SEGMENT SHELL—*continued.*

September 13, 1864.

RANGE, 1,300 yards.

Segment shell with percussion fuzes, fired so as to strike the ground at different distances in front of the targets, and burst on graze.

The targets consisted of three lines of 2-inch deal targets, 9 × 9 feet, five in each line, 6 yards interval between the lines.

## ROUGH USAGE.

*Practice on October 18, 1864.*

The 12-pounders that had been in the muddy ditch all night were this morning taken out, and with the view of ascertaining which of the guns could be got ready for action in the shortest possible time, the following experiment was carried out :—

The three guns being in the condition that they were in when taken out of the ditch, viz., covered more or less with thick mud, and with their bores more or less full of the same, were placed on the sea wall, detachments told off for them, and ten rounds

solid shot were fired from each as rapidly as possible, the time being taken from the word "load."

## RESULTS :—

Fired the 1st round in 3m. 30s.

" 10th " 7m. 50s.

*Note.*—Very considerable delay (amounting to probably one minute) was experienced in firing the first of these rounds, owing to the priming wire and prickler, &c. having been mislaid.

## EFFECT OF PREMATURE BURSTING OF SHELL IN THE BORE.

4 Common shell,

5 Segment shell,

were burst as nearly as possible at the seat of the shot.

To ensure this a hole was bored in the base of the shell and the lubricator and end of the cartridge removed so as to bring the cartridge in contact with the burster of the shell.

The bore was not damaged in the slightest degree.

10 rounds solid shot were fired at a target, the result showed that the accuracy of the gun was not impaired.

The ammunition did not appear to be in any way damaged.

*December 22, 1864.*

The gun was laid on skidding on the sand, and fired at with solid shot from a 9-pounder Armstrong gun. Charge,  $1\frac{1}{4}$  lb. Range, 40 yards.

*1st Shot.*—Struck the gun on the chase, made a slight dent, and glanced off, striking the shoulder of the trunnion, which it dented.

The direction of the shot was at an angle of  $30^\circ$  with the axis of the gun.

*2nd Shot.*—Struck full on the chase, knocked the gun two feet off the skidding, and dented it.

The gun was subsequently fired 4 rounds. At the second round the projectile stuck about 4 inches down the bore, but it was rammed home with little difficulty.

*October 28, 1864.*

10 rounds solid shot,

10 " shrapnel shell,

10 " common shell,

which were placed in wet straw in April last and periodically wetted with sea water, were fired to-day.

## RAPID FIRING.

*April 19, 1864.*

200 rounds of solid shot were fired, not as a competition as to rapidity of firing, but the firing to be continuous, carried on as rapidly as service considerations would admit of.

The gun detachment consisted of six men, and was relieved every 30 rounds.

The position of the gun was determined by lot, as follows :

Muzzle-loading Armstrong, No. 2, centre.

The gun detachments and officers were selected also by lot.

The time taken in firing the 200 rounds was as follows :—

1 hour 21 minutes.\*

At the conclusion of this firing the gun fired 8 rounds of common shell (blind) at 9-foot targets, 300 yards range, to hit the bull's eye ; three first rounds, trial shots ; 5 last recorded—

1. 7'00 inches from centre.
2. 4'25                   "
3. 7'5                   "
4. 5'25                   "
5. 14'25                  "

*May 19, 1864.*

99 rounds solid shot were fired entirely by men of the Royal Artillery, the gun detachment being changed every 30 rounds until 60 rounds had been fired, and

\* The cartridges were too high gauge for this gun ; several had to be rejected, as they would not enter the bore. The wads were not attached to the cartridges.

afterwards every 13 until the conclusion of the experiment.

One 6-foot floating target. Range, 1,200 yards. Elevation, 2° 17'.

|               |     | Min. | Sec. |
|---------------|-----|------|------|
| 1st 20 rounds | - - | 11   | 57   |
| 2nd 20   "    | - - | 10   | 7    |
| 3rd 20   "    | - - | 10   | 20   |
| 1st 13   "    | - - | 10   | 16   |
| 2nd 13   "    | - - | 8    | 16   |
| 3rd 13   "    | - - | 6    | 43   |
| Total         | - - | 57   | 39   |

21 hits on the target.

One high cartridge caused some little delay in 2nd 20 rounds.

*June 1, 1864.*

100 rounds of solid shot were fired by men of the Royal Artillery.

The detachments were changed every 20 rounds.

The gun was laid on a target at various distances.

First 2 shot trial.

The times taken were as follows :—

|           |     | Min. | Sec. |
|-----------|-----|------|------|
| 18 rounds | - - | 8    | 28   |
| 20   "    | - - | 7    | 45   |
| 20   "    | - - | 7    | 59   |
| 20   "    | - - | 7    | 32   |
| 20   "    | - - | 5    | 30   |
| Total     | - - | 37   | 14   |

Various trifling delays occurred during the 18 rounds, owing to the platform shifting.

## WITHOUT LUBRICATORS.

*November 10.*

20 rounds solid shot were fired without lubricators.

Time 9 minutes.

The practice was excellent.

66 rounds were then fired as rapidly as possible.

Time 19 minutes.

The detachments were changed so that each detachment worked each gun, and at the conclusion of

the practice Nos. 1, 2, 3, were asked their opinion as to ease of working.

No. 1 preferred Whitworth as easier to lay.

2   "   M.L. Armstrong as easier to load.

3   "   Whitworth, but could give no reason.

All agreed that the muzzle-loaders were far preferable to the breech-loader.

## SEA SERVICE TRIALS.

The gun was mounted on a common boat's carriage, in the bows of a 32-foot pinnace.

## INDEPENDENT FIRING.—November 3, 1864.

Ten rounds were fired from each gun independently with shot, the boats having very slight but rapid rolling, pitching, and yawing motions.

Wind  ; force, 2.

12-pounder Armstrong's  
Muzzle-loader—Shunt.

Shot, 12 lbs.  
Charge,  $1\frac{3}{4}$  lbs.  
Distance of target, 1,800 yards.  
Elevation,  $4^{\circ} 0'$ .

10 rounds were completed in  
15' 0".

Recoil, 2 ft. 6 in. and a taut  
breaching.

Sponging and loading was  
performed with difficulty,  
owing to the length of the  
gun. The loading num-  
bers were much exposed,  
and the sponge being high,  
delayed the gun.

Total numbers gained in this  
practice - - - 53

November 8, 1864.

## DISEMBARKING.

The 12-pounder competitive guns were thrown ashore (on Southsea beach) from the boats, and practised without loss of time as naval field pieces, to ascertain their comparative merits under the circumstances.

Guns, field carriages, and limbers were thrown overboard, as the boats touched the beach, and roused ashore by the drag ropes. The limber boxes were carried on shore by the limber numbers. When the guns were mounted they were "Rear" limbered up and marched about 10 yards higher up the beach; then "Action—Rear," "Load," "1° elevation and lay for the horizon," "Fire," "Cease—Firing."

The following several period of time are recorded against each gun during the evolutions; the difference between the times connected with the mounting of carriage and limber must be attributed to the crews only; but those connected with the handling of the guns may fairly be due to their difference in weight and handiness.

| Boats touching beach to the time when |   |   | m.         | s. |
|---------------------------------------|---|---|------------|----|
| guns were overboard                   | - | - | 0          | 30 |
| Carriage landed                       | - | - | 1          | 20 |
| " mounted                             | - | - | 2          | 0  |
| Limber landed                         | - | - | Not taken. |    |
| " mounted                             | - | - | 3          | 22 |
| Gun mounted                           | - | - | *4         | 30 |
| "Rear—Limber up"                      | - | - | 4          | 36 |
| "Action—Rear"                         | - | - | 6          | 40 |
| "Load" †                              | - | - | 6          | 44 |
| "Fire"                                | - | - | 8          | 15 |

Very little cleansing was required;  
the guns were dragged breech foremost  
through water, sand, and shingle.

## ABSTRACT OF PRACTICE.

|                                                                                       |              |      |               |       |                          |       |                               |  |                                                       |  |

\* The handspike across the rear of the gun slipped repeatedly.

† The order "Load" followed immediately, "Action—Rear."

## INITIAL VELOCITY AND RETARDATION.

---

The following abstracts show the results of experiments made to ascertain the initial velocity and retardation of projectiles fired from the Armstrong and Whitworth 12-pounder guns.

The experiments were carried on at Shoeburyness on the 2nd, 3rd, and 4th May and 12th August 1864. The velocities being determined by means of the electro-ballistic pendulum, invented by Major Navez, of the Belgian Artillery, two of these instruments were employed simultaneously in the investigations, and the velocity of each shot was determined at two points in the trajectory, one near the muzzle of the gun, the other at a considerable distance from it; the velocity which the projectile lost in passing over the space included between the two points was thus ascertained:—Five good observations were obtained with each projectile.

The common shell were all brought to the same weight, so that the guns might be tested under similar circumstances as regards weight of charge and weight of projectile.

The velocities of the projectiles were observed at 40, 440, and 840 yards from the muzzle.

*Table I.* shows the mean observed velocity of the projectiles.

*Table II.* shows the comparative gain and loss of velocity of the projectiles.

*Table III.* shows the details of the practice with Whitworth gun.

*Table IV.* shows the details of the practice with the M.L. Armstrong gun.

*Table V.* shows the details of the practice with the B.L. Armstrong gun.

*Table VI.* shows the density of the air on each day during the experiments.

TABLE I.

TABLE showing the mean observed Velocities, &c. of Projectiles fired from Armstrong and Whitworth competitive Field Guns.

DESCRIPTION OF TABLE I.

Column I. Number of rounds included in the mean total.  
 " II. Nature of ordnance used.  
 " III. Weight of charge in pounds, and brand of powder.  
 " IV. & V. Nature and weight of projectile.  
 " VI. Proportion between the weight of projectile and weight of charge, or weight of charge in pounds divided by weight of projectile in pounds.  
 " VII. The velocity of the projectile, in feet per second, at a distance of 40 yards from the muzzle of the gun.

Column VIII. The velocity of the projectile, in feet per second, at a distance of 840 yards from the muzzle of the gun. Lower in the column at 440 yards.  
 " IX. The velocity, in feet, lost in passing through 800 yards of air. Lower in the column, the loss in 400 yards, or the difference between columns VII. and VIII.  
 " X. The calculated velocity at the muzzle of the gun.

TABLE II.

TABLE showing the comparative Gain and Loss in Velocity of Projectiles fired from Armstrong and Whitworth competitive Field Guns, the 12-pounder Whitworth being taken as the standard.

| Nature of Gun.          | Charge. | Nature of Projectile.                 | Initial Velocity. |           |           | Observed loss of Velocity in 800 Yards. |           |               |
|-------------------------|---------|---------------------------------------|-------------------|-----------|-----------|-----------------------------------------|-----------|---------------|
|                         |         |                                       | Rate per Second.  | Increase. | Decrease. | Amount.                                 | Increase. | Decrease.     |
|                         | Lbs.    |                                       | Feet.             |           |           | Feet.                                   |           |               |

DESCRIPTION OF TABLE II.

Column I. Nature of ordnance used.  
 " II. Weight of the charge in pounds.  
 " III. Nature of projectile used.  
 " IV. Velocity, in feet per second, of projectile at the muzzle of the gun.  
 " V. & VI. Difference between the velocities of the Armstrong projectiles and the Whitworth projectile.

Column VII. The amount of velocity, in feet, which the projectile lost in 800 yards. Vide Table I., col. IX.  
 " VIII. & IX. Difference between the loss experienced by the Armstrong projectiles and the Whitworth projectile.

TABLE III.

TABLE showing the Total Number of Rounds fired for Velocity and Retardation. Armstrong and Whitworth competitive Field Guns.

12-Pounder M.L. Whitworth Gun, R. No. 264.

| Date of Experiment. | No. of Round. | Charge.   | Projectile.                                                            |              |                            | Observed Velocities. |                      |                    | Remarks.                              |

Lubricating wads used throughout.

#### DESCRIPTION OF TABLES III., IV., and V.

|                  |                                                                     |                   |                                                                                                                            |
|------------------|---------------------------------------------------------------------|-------------------|----------------------------------------------------------------------------------------------------------------------------|
| Column I.        | Date on which the experiment detailed in the Table was carried out. | Col. VII. & VIII. | The velocities of the projectiles at each round. Columns VII and VIII, Table I, give the means of these velocities.        |
| " II.            | Number of the round, in the order in which it was fired.            | " IX.             | The loss in 800 yards, or the difference between Columns VII and VIII. Column IX, Table I, gives the mean of these losses. |
| " III.           | Weight of charge, in pounds.                                        | " X.              | Remarks. Number of rounds which were necessary to fire, in order to hit the wire screens at 800 yards &c.                  |
| " IV., V., & VI. | Nature, weight in pounds, and diameter in inches of the projectile. |                   |                                                                                                                            |

TABLE VI.

TABLE showing the Density of the Air on each Day of Experiment with Navez's apparatus, during the trial of the 12-pounder competitive Armstrong and Whitworth guns. The weight of one Cubic Foot of Dry Air at a temperature of 32° Fahrenheit, and pressure of 30 inches = 563 grains being taken as the unit.

| Date.   | Barometer observed at 3 p.m. |              | Barometer corrected. | Thermometer observed. |      | Relative Humidity. | Weight of One Cubic Foot of Air. | Relative Proportion to Standard. | Remarks.]            |
|---------|------------------------------|--------------|----------------------|-----------------------|------|--------------------|----------------------------------|----------------------------------|----------------------|
|         | Height.                      | Temperature. |                      | Dry.                  | Wet. |                    |                                  |                                  |                      |

# **70-PR. GUNS.**

---

**EXPERIMENTS carried out by the SPECIAL ARMSTRONG  
and WHITWORTH COMMITTEE.**

70-POUNDER WEDGE BREECH-LOADING ARMSTRONG GUN.

EXPERIMENTS FOR DETERMINING RANGE AND ACCURACY.

N.B.—The figures in *Italics* are the rounds struck out by the competitors as abnormal shots.

SHOT (HOLLOW-HEADED). SHOE BURYNESS.

*Particulars of Gun.*  
Weight, 61·6 cwt.  
Length, 9 ft. 1·95 in.  
Diameter of bore, 6·4 in.  
Length of bore, 7 ft. 7·95 in.  
Grooves { No. 70.  
          { Width, 0·175 in.  
          { Depth, 0·85 in.  
Spiral, 1 turn in 40 calibres.

*Particulars of Projectile and Ammunition.*  
Weight, 71·87 lbs.  
Diameter, 6·43 in.  
Length, 12·26 in.  
Length of cartridge, 12 in.  
Diameter of cartridge, 5 in.  
Brand of powder, A4.  
Charge, 9 lbs.  
Wad, service lubricator.

COMMON SHELL (WEIGHTED WITH SAND).

PARTICULARS OF SHELL AND AMMUNITION.

N.B.—The figures in *Italics* are the rounds struck out by the competitors as abnormal shots.

SHOEBURYNESS.

*Projectile.*

Nature, common shell.  
Weight, 68 $\frac{3}{4}$  lbs.  
Diameter, 6·43 inches.

Length, 14·66 inches.  
Bursting charge, 4·8 lbs.

RANGE AND ACCURACY—*continued*.

## SEGMENT SHELL (WEIGHTED WITH SAND.)

## PARTICULARS OF SHELL AND AMMUNITION.

Nature, segment shell.  
Weight, 77.6 lbs.  
Diameter, 6.43 inches.

Length, 13.85 inches.  
No. of segments, 112.  
Bursting charge, 1 lb.

COMMON SHELL (WEIGHTED WITH SAND).

PARTICULARS OF SHELL AND AMMUNITION.

N.B.—The figures in *Italics* are the rounds struck out by the competitors as abnormal shots.

SHOEBURYNESS.

*Projectile.*

Nature, common shell.  
Weight, 68½ lbs.  
Diameter, 6·43 inches.

Length, 14·66 inches.  
Bursting charge, 4·8 lbs.

## RAPID FIRING.

SHOEBURYNESS.

*July 7, 1864.*

The gun was mounted on a rear chock carriage on an ordinary ground platform and worked by men of the Royal Artillery.

The detachments were changed every 20 rounds.

*Shot.*

|                                 |   |   |                           |
|---------------------------------|---|---|---------------------------|
| The 1st 20 rounds were fired in |   |   | 12 $\frac{1}{2}$ minutes. |
| 2nd                             | " | " | - 13 $\frac{1}{2}$ "      |
| 3rd                             | " | " | - 13 $\frac{1}{2}$ "      |
| 4th                             | " | " | - 19 "                    |

This gun detachment never saw a wedge gun before, and only one man of the detachment had been drilled with Armstrong guns.

|                                 |   |   |                           |
|---------------------------------|---|---|---------------------------|
| The 5th 20 rounds were fired in |   |   | 12 $\frac{1}{2}$ minutes. |
| 6th                             | " | " | - 17 "                    |

During the last 20 rounds the wedge worked stiffly.

At the conclusion of the experiment a small quantity of water was thrown into the slot, and the wedge then worked as freely as at the commencement of the practice.

70-POUNDER WHITWORTH GUN. (FIRED FROM REAR-VENT.)

EXPERIMENTS FOR DETERMINING RANGE AND ACCURACY.

N.B.—The figures in *Italics* are the rounds struck out by the competitors as abnormal shots.

COMMON SHELL (WEIGHTED WITH SAND).

PARTICULARS OF SHELL AND AMMUNITION.

N.B.—The figures in *Italics* are the rounds struck out by the competitors as abnormal shots.

SHOEBURYNESS.

Weight, 67 lbs. 7 oz., empty.

Diameter { major, 5.46 in.  
              minor, 4.98 in.

Length, 17.985 inches.

Bursting charge, 2 lbs. 14 oz.

Firing from the rear vent ; cartridge adapted for the purpose.

RANGE AND ACCURACY—*continued*.

## BOXER'S SHRAPNEL SHELL (WEIGHTED WITH SAND).

## PARTICULARS OF SHELL AND AMMUNITION.

N.B.—The figures in *Italics* are the rounds struck out by the competitors as abnormal shots.

SHOEBURYNESS.

Weight, 67·7 lbs.

Diameter { major, 5·46 in.  
minor, 4·98 in.

Length, 15·58 in.

No. of bullets, 199.

Bursting charge, 3 or 6 oz.

Firing from rear vent ; cartridge adapted for the purpose.

|                                 | 6 "       | 1        | 1       | 0       |                                |           |                                               |         |         |

The shells were fired through a screen 4 inches in thickness, so as to burst 10 yards in front of the 1st line of targets.

Three lines of targets 10 yards apart.

## PENETRATION INTO MASONRY.

DESCRIPTION OF TOWER.—(See *Lithograph opposite.*)

The Tower was built in the year 1804, and is stated to have cost 3,000*l*. It is of brick, able to accommodate 20 men, with magazine space for 80 barrels or 70 cases of powder. Like all the Martello Towers on this part of the coast, it is designed for one gun. The wall on the side fired at is 7 feet 6 inches thick at the level of the ground, and 5 feet 9 inches at the spring of the vault, which is 19 feet from the ground. It is 31 feet 6 inches high, but receives considerable support, at 12 feet above the ground, from the joists of the floor, which radiate from a central pillar and abut against it. To a certain extent also the basement floor, at 2½ feet above the ground, may be regarded as a support. In appearance the Tower was perfectly sound, the brickwork having been protected by a coating of plaster. The parapet, 5½ feet high and 5 feet thick, was coped with Bramleyfall stone, in blocks containing 7 or 8 cubic feet; a step 2 feet high, round the interior, served the double purpose of a banquette and of a support for the front racers of a rear pivot-traversing platform turning the entire circle. The racer itself was laid on granite curb-stones of about half a ton weight each. Thus a great solidity characterized the whole structure. The roof was formed of a bomb-proof vault, supported in the centre by a pillar 4 feet in diameter, turned in three courses of bricks, and surmounted by an equal thickness of ordinary brickwork, giving altogether about 5 feet of masonry over the crown of the arch. The diameter of the whole at the top was 40 feet, and nearly 46 feet at the bottom.

*Bexhill, October 19, 1864.*

RANGE, 750 yards.

Centre gun.

*1st Round—Common Shell*, filled with sand.

Struck 4 feet 6 inches below the floor line, 15 feet left of door; passed through the wall, the pieces of the shell found inside; wall, 7 feet thick.

*2nd Round.*

Passed through the same hole as No. 1; cut a piece out of the centre supporting column; shell broke up.

*1st Round—Solid Shot.*

Struck in the same hole as No. 1 muzzle-loading Armstrong; penetration, 7 feet; the shot found reversed against granite curb, with the head pointing towards the guns.

*2nd Round.*

Struck exactly in the same relative position as the muzzle-loading Armstrong No. 1; shot passed through the wall 6 feet 8 inches thick and indented the opposite wall to a depth of 8 inches.

*3rd Round.*

Struck on broken-up part of parapet; passed through and fell expended on the other side of the platform.

*October 20, 1864.*

*4th Round.*

Passed through a broken part; struck the granite arch; shot broke up.

*5th Round.*

Struck well on the solid; broke through the crown of the arch, the shot having been deflected downwards; shot fell inside exhausted; penetration, 7 feet 3 inches.

COMMON SHELL—BOXER'S TIME FUZE, 5 in.

Bursting charge, 2 lbs. 10½ oz.

*1st Round.*

Shell penetrated 5 feet and burst; broke away a cavity, inside 18 inches in diameter; diameter outside, 1 foot; the wall bulged inside from the ground to 3 feet above it; some portion of brickwork scaled away.

*2nd Round.*

Hit on the damaged part of wall made by No. 1 breech-loading common shell, live; penetration, 5 feet 4 inches; shell burst; area of damage inside, 4 feet × 4 feet × 9 inches.

Struck the inside of the sea face, the land face having been destroyed on the level of the spring of the arch; masonry, 9½ feet thick; three bricks on the outside face loosened, one cracked, and a slight crack on the face of the tower.

## COMMON CASE.

December 21, 1864.

At a line of six 9-feet targets.

RANGE, 500 yards.

|             | 6 "      | 4        | 0       | 1       |
| 2nd round - | 1 target | 2        | 0       | 0       |
|             | 2 "      | 20       | 2       | 0       |
|             | 3 "      | 239      | 4       | 8       |
|             | 4 "      | 186      | 2       | 5       |
|             | 5 "      | 18       | 1       | 2       |
|             | 6 "      | 1        | 1       | 0       |

Each record is the result of three rounds of common case.

## TRIAL OF FUZES.

December 22, 1864.

Trial of time fuzes. The time was taken with three stop clocks; the fuzes were fixed in shrapnel shell.

Elevation, 3°. Fuze bored to 0.5 of an inch.

| Stop Clock. | 1st Round. | 2nd Round. | 3rd Round. | 4th Round. | 5th Round. |
|-------------|------------|------------|------------|------------|------------|
| No. 1       | sec. 2.5   | sec. 2.1   | sec. 2.5   | sec. —     | sec. 2.1   |
| " 2         | 2.1        | —          | 2.3        | 2.4        | 2.1        |
| " 3         | 2.2        | —          | 2.6        | 2.2        | 2.1        |

February 20, 1865.

Elevation, 4°. Fuze set to 0.5 inch.

| Stop Clock. | 1st Round. | 2nd Round. | 3rd Round. | 4th Round. | 5th Round. |
|-------------|------------|------------|------------|------------|------------|
| No. 1       | sec. —     | sec. —     | sec. —     | sec. 2.1   | sec. 2.1   |

| " 2         | 4.2        | 4.6        | 4.1        | 4.6        | 4.4        |
| " 3         | 4.2        | 4.6        | 4.1        | 4.5        | 4.6        |

## FUZES.

December 21, 1864.

The following experiment was carried on to ascertain whether the common wood fuze could be used with the muzzle-loading guns. 70-pounders; shrapnel shell; charge, 10 lbs.

*Ordinary Lubricator.*

|           |                  |          |
|-----------|------------------|----------|
| 1st round | - M.L. Armstrong | - Burst. |
| "         | - Whitworth      | - Blind. |
| 2nd round | - M.L. Armstrong | - "      |
| "         | - Whitworth      | - "      |
| 3rd round | - M.L. Armstrong | - "      |
| "         | - Whitworth      | - Burst. |
| 4th round | - M.L. Armstrong | - Blind. |
| "         | - Whitworth      | - Burst. |
| 5th round | - M.L. Armstrong | - "      |
| "         | - Whitworth      | - Blind. |
| 6th round | - M.L. Armstrong | - "      |
| "         | - Whitworth      | - "      |
| 7th round | - M.L. Armstrong | - "      |
| "         | - Whitworth      | - "      |

*Without Lubricator.*

|           |                  |                 |
|-----------|------------------|-----------------|
| 1st round | - M.L. Armstrong | - Burst.        |
| "         | - Whitworth      | - "             |
| 2nd round | - M.L. Armstrong | - Burst in gun. |
| "         | - Whitworth      | - Burst.        |
| 3rd round | - M.L. Armstrong | - "             |
| "         | - Whitworth      | - "             |
| 4th round | - M.L. Armstrong | - "             |
| "         | - Whitworth      | - "             |
| 5th round | - M.L. Armstrong | - "             |
| "         | - Whitworth      | - Blind.        |

The following experiment was carried on to ascertain whether the Boxer fuze supplied for Whitworth guns would be extinguished by the shell striking the water.

The fuze was bored to 1 inch, and the gun laid point blank:—

|           |                          |
|-----------|--------------------------|
| 1st round | - Burst after 1st graze. |
| 2nd "     | - " 2nd "                |
| 3rd "     | - " 1st "                |
| 4th "     | - " 1st "                |

Fuze cut to  $1\frac{1}{2}$  inches:—  
1st round - Blind.

ROUGH USAGE.

---

*June 22, 1865.*

To ascertain the effect of shot striking the gun, it was laid on skidding, and fired at with a 40-pr. Armstrong breech-loading gun at a range of 40 yards, with solid cast-iron shot.

*1st Round.*

The gun was laid with its muzzle pointing towards the 40-pr. at an angle of about  $20^{\circ}$  with the line of fire.

Struck 38 inches from the muzzle, on the edge of the front hoop; made an indentation.

A shot was rammed home.

*2nd Round.*

The gun was laid with its muzzle pointing towards the 40-pr. at an angle of about  $35^{\circ}$  with the line of fire.

Struck nearly on the same spot as last; made an indentation.

A shot was rammed home.

*3rd Round.*

The gun was laid with its muzzle pointing towards the 40-pr. at an angle of about  $85^{\circ}$  with the line of fire.

Struck on the hoop in front of the trunnion and started the hoop.

Both bore and barrel were uninjured.

*4th Round.*

The gun laid exactly in the same position as for the last round.

Hit full on the chase at 29 inches from the muzzle; the inside of the bore was bulged, so that a shot could not be rammed home.

The gun was not cracked, but it was unserviceable.

---

Thirty shot were thrown into a wagon and out again in a heap; this was twice repeated. The shot were subsequently fired without difficulty.

## SEA SERVICE TRIALS.

## EASE OF WORKING AS A BROADSIDE GUN.

The gun was mounted on a common truck carriage, having depression chock, bed, and elevating screw, and worked by a crew of 15 men.

The peculiarities appertaining to its fittings and stores, as differing from the land service, are as follows:—

Fair leader, with roller for trigger line, but no half-cock cleat; a wooden one was improvised.

*Gun gear.*—Eight-inch breeching (rove through carriage brackets and hitched in the first place to allow a recoil of about six feet).

A 9-inch breeching was rove on the third day of the practice.

The Whitworth cartridges not having arrived on the first day of the competitive trial on board the "Excellent," the practice was not commenced with this gun until November 1st, 1864.

The peculiarities in the fittings and stores, as differing from the sea service, were—

*The vent.*—The vent is placed in the rear of the gun; it is contained in an iron cylinder bouched with copper, the former being screwed into the gun, having recesses round its surface to contain wax for lubrication to enable the cylinder to be removed without difficulty.

The copper bouche is screwed into the iron cylinder and terminates in a cylinder of platinum, which has a hemispherical end projecting into the rear of the gun.

The vent is bored through the copper bouch and is .22 inch in diameter until it arrives at the platinum, where it is reduced to .1.

On the evening of October 31, 1864, Mr. Whitworth deemed it necessary, and was allowed to recess the outer part of his rear vent.

*The vent cover.*—A cylinder vent cover of iron, to catch the tubes at the neck ring, travelled to and fro, working by a handle, for the purpose of getting at the vent to prime or serve it.

Copper tubes (land service) were used with this gun.

*The sponge.*—Thrummed head and cylindrical brush, both separately revolving; the bristles are placed as the twist of the grooves.

*Extractor.*—Three tumbler prongs at the end of a staff adaptable to the head of projectile, and made to close thereon by a screw plate acting upon the tumbler ends.

November 1, 1864.

## INDEPENDENT FIRING.

Solid shot, 71 lbs.

Charge, 10 lbs.

Distance of target, 2,600 yards.

Size of target, 14 feet square.

Elevation, 5°.

Deflection, 0.

Wind  ; force, 3 to 4.

The intervals of time between the successive rounds were as follows:—

The Nos. awarded for accuracy are in italics.

Rounds from 1 to 12 in regular succession.

| —     | Nos. | —     | Nos. | —     | Nos. |
|-------|------|-------|------|-------|------|
| m. s. |      | m. s. |      | m. s. |      |
| 0 00  | 4    | 0 50  | 4    | 0 49  | 6    |
| 1 22  | 5    | 0 51  | 6    | 0 35  | 6    |
| 1 8   | 5    | 0 41  | 4    | 0 39  | 5    |
| 5 40  | 5    | 0 34  | 5    | 0 36  | 0    |

After the 3rd round, two strands having gone in the nip of the clinch, the breeching was shifted, delaying the gun 3 minutes 45 seconds.

At the 5th round, a delay of 5 seconds occurred from a miss-fire, occasioned by the trigger becoming unhooked.

Deducting these times, the 12 rounds were fired in 9 minutes 55 seconds.

(Average time between each of the rounds, 54.1 seconds.)

November 2, 1864.

Twenty rounds were fired under the same circumstances as yesterday, except that 5° 20' elevation was used instead of 5°, and a new 9-inch breeching had been rove, hitched to allow 6 feet recoil.

Wind  ; force, 3.

## Rounds from 12 to 32.

| —     | Nos. | —     | Nos. | —     | Nos. | —     | Nos. |
|-------|------|-------|------|-------|------|-------|------|
| m. s. |      | m. s. |      | m. s. |      | m. s. |      |
| 0 00  | 0    | 0 45  | 0    | 0 38  | 0    | 0 48  | 0    |
| 0 46  | 0    | 0 40  | 0    | 0 54  | 5    | 0 37  | 4    |
| 0 49  | 5    | 0 47  | 5    | 0 50  | 0    | 0 48  | 5    |
| 0 41  | 4    | 0 43  | 4    | 0 44  | 0    | 0 45  | 4    |
| 0 44  | 0    | 0 43  | 5    | 0 43  | 0    | 0 50  | 5    |

Completed in 14 minutes 15 seconds.

(Average time between each of the rounds, 45 seconds.)

Burnt priming at the 3rd round.

The gun hung fire at the 12th and 14th rounds.

At the 7th round the cylinder cover for vent began to work stiffly, and at the 10th round it jammed hard, and was subsequently left open altogether.

After the 12th round, 3 and 5 and 4 and 6 changed places.

At the conclusion of this firing the breeching had stretched and the hitches were closed up, allowing the gun to come in 7 feet 6 inches.

November 3, 1864.

Before commencing practice on this day, the vent was again removed and the contracted portion reamed out to .15 inch.

The breeching was hitched to allow 6 feet recoil.

The cartridges used were those obtained from Woolwich; the previous firing had been carried out with those altered at Portsmouth.

Wind  ; force, 2 to 3.

Twenty rounds were fired with the following intervals:—

## Rounds from 70 to 90.

| —     | Nos. | —     | Nos. | —     | Nos. | —     | Nos. |
|-------|------|-------|------|-------|------|-------|------|
| m. s. |      | m. s. |      | m. s. |      | m. s. |      |
| 0 00  | 5    | 0 42  | 0    | 0 40  | 0    | 0 57  |      |
| 0 44  | 5    | 0 54  | 5    | 0 59  | 6    | 2 25  |      |
| 0 41  | 6    | 0 40  | 0    | 0 31  | 6    | 0 46  | 6    |
| 0 30  | 5    | 0 35  | 0    | 0 51  | 5    | 0 38  | 4    |
| 0 29  | 5    | 0 35  | 0    | 0 54  | 6    | 0 31  | 0    |

At the 11th round the tangent sight slipped down, delaying the gun 14 seconds.

Deducting this time, the 20 rounds were fired in 14 minutes 48 seconds.

EASE OF WORKING—*continued.*

(The average time between each of the rounds being 41·5 seconds.)

“Burnt priming” at the 16th round.

The captain of the gun used the vent bit whilst loading for the 17th round.

“Burnt priming” (twice) at the 17th round.

Used vent bit, then “burnt priming” again.

After a considerable pause, the charge ignited while the captain of the gun was clearing the vent.

The breeching had now stretched out, allowing the gun 7 feet recoil.

November 2, 1864.

## QUICK FIRING.

Eighty rounds were fired with, shot, 71 lbs., charge, 10 lbs., at an elevation of 5° on account of the danger of ricochet in Portsmouth Harbour.

The direction had also to be got on for the same reason.

Nine-inch breeching; allowing 7 feet 6 inches recoil at the commencement.

The vent cover was left open altogether.

The first 20 rounds were fired with the following intervals between the successive rounds:—

These 20 rounds were from the 32nd to the 52nd in the regular succession of firing.

| m. | s. | m. | s. | m. | s. | m. | s. |
|----|----|----|----|----|----|----|----|
| 0  | 00 | 0  | 30 | 0  | 35 | 0  | 30 |
| 0  | 30 | 0  | 30 | 0  | 30 | 1  | 6  |
| 0  | 30 | 0  | 40 | 0  | 45 | 1  | 4  |
| *0 | 45 | 0  | 30 | 0  | 45 | 0  | 40 |
| 0  | 30 | 0  | 35 | 0  | 30 | 0  | 35 |

At the 3rd round, the trigger line carried away.

Shifting it and a “miss-fire” at the 4th round delayed the gun 10 seconds.

Deducting this time, the 20 rounds were fired in 11 minutes 50 seconds.

(Average time between each of the rounds, 37·3 seconds.)

After the 12th round, 3 and 5, and 4 and 6 changed places.

The low-gauge sponge was used by mistake for several rounds.

Pointing was seldom resorted to, as the gun was run out in the right direction.

At the conclusion of the firing, the breeching had stretched, and the hitches were closed up, allowing the gun to come in 8 feet 6 inches.

Eighteen rounds were then fired with the following intervals:—

Rounds from 52 to 70.

| m. | s. | m. | s. | m. | s. | m. | s. |
|----|----|----|----|----|----|----|----|
| 0  | 00 | 0  | 30 | 0  | 22 | 0  | 34 |
| 0  | 25 | 1  | 5  | 0  | 28 | 0  | 51 |
| 0  | 32 | 0  | 35 | 0  | 51 | 0  | 47 |
| 0  | 28 | 0  | 27 | 0  | 31 |    |    |
| 1  | 5  | 1  | 3  | 0  | 28 |    |    |

“Burnt priming” at the 4th (twice), 9th, 12th, 17th, and 18th rounds.

The gun hung fire at the 15th round.

The hook of left side tackle carried away at the 6th round, delaying the gun 14 seconds.

Deducting this time, the 18 rounds were fired in 9 minutes 48 seconds.

(Average time between each of the rounds, 34·6 seconds.)

The loading numbers were not changed as before.

In attempting to fire a 19th round, “burnt priming” three times; endeavoured to clear the passage with “vent bit,” then “burnt priming” again three times. This happened about 1.20 p.m., the gun being temporarily disabled, and it being necessary to take out the vent.

The shot was drawn readily by the extractor.

The hexagonal top of lubricator was then drawn out by the worm, and afterwards the cartridge was removed by the extractor.

The vent was taken out of the gun by Mr. Whitworth's foreman, and on examination the contracted part was found to be clogged with deposit from the gas.

The vent was cleared, cleansed, and replaced by half-past 3 p.m., but no further practice took place on this day, the range being foul.

November 3, 1864.

Twenty rounds were fired under the same circumstances as yesterday, except that the vent had been reamed out to 15 inch.

Breeching allowed 7 feet recoil.

Wind  ; force, 2 to 3.

Twenty rounds were fired with the following intervals:—

Rounds from 90 to 112.

| m. | s. | m. | s. | m. | s. | m. | s. |
|----|----|----|----|----|----|----|----|
| 0  | 0  | 0  | 34 | 0  | 27 | 0  | 35 |
| 0  | 30 | 0  | 30 | 0  | 49 | 0  | 35 |
| 0  | 47 | 0  | 33 | 0  | 30 | 0  | 40 |
| 0  | 33 | 0  | 31 | 0  | 32 | 0  | 40 |
| 0  | 36 | 0  | 30 | 0  | 28 | 0  | 32 |

At the 11th round split the right rear truck, a delay of 10 seconds in shifting ditto.

Deducting this time, the 20 rounds were fired in 10 minutes 42 seconds.

(The average time between each of the rounds, 33·8 seconds.)

Two rounds were then fired from this gun to make up the number to the same as that fired from the shunt and from the wedge guns.

“Burnt priming” (twice) at the 1st round: cleared with the vent bit.

## WITHOUT LUBRICATORS.

Twenty rounds were then fired.

Rounds from 112 to 132.

| m. | s. | m. | s. | m. | s. | m. | s. |
|----|----|----|----|----|----|----|----|
| 0  | 0  | 0  | 35 | 1  | 58 | 0  | 30 |

| 0  | 39 | 0  | 27 | 0  | 30 | 0  | 40 |

In 12 minutes 56 seconds.

(Average time between each of the rounds, 40·8 seconds.)

No difficulty was experienced in loading.

Very little pointing was required.

“Burnt priming” at the 7th, 11th (twice), and 12th rounds; the vent bit was used for clearing on each occasion. During the last eight rounds, the captain of the gun pricked the charge after every three rounds, whilst running out.

The recoil was noticed as more violent on this day than previously. The gun ran out some distance by the reaction from “taut breeching.”

After this practice it was noticed that the sponge head had worn away, exposing an iron nail that secured the thrumming.

The vent had evidently been struck constantly by this hard metal, and on examination after removing the vent, its platinum face was found to be slightly hammered, and the orifice closed to 1 inch in diameter.

The vent was also clogged with fouling, and a slight burr was apparent about the joint of the hard and soft metals.

The solid breech of the gun had been unscrewed about 3 of an inch by the previous firing.

In cleaning the gun a mass of deposit was drawn out, which had collected on and around the vent; it appeared to be composed of fragments of the cartridge accumulating after each discharge.

## EASE OF WORKING. (PIVOTING SLIDE CARRIAGE.)

November 7, 1864.

FIRING AT SPITHEAD EN RICOCLET,  
EMPTY SHELL.

Ten rounds were fired en ricochet, the gun being laid for the horizon with  $1^{\circ}$  elevation.

Empty shell, (common)  $67\frac{1}{2}$  lbs.

Charge, 10 lbs.

Length of shell,  $17\cdot95$  inches.

The deviation after first graze is recorded below, and the time of flight between first and second grazes shows approximately the height to which the projectiles rose after striking the water, thus exhibiting the uncertainty of hitting the enemy en ricochet.

| Rounds. | Deviation after 1st Graze. | Time of Flight between 1st and 2nd Grazes. | Rounds. | Deviation after 1st Graze. | Time of Flight between 1st and 2nd Grazes. |

## SHELL WITH PERCUSSION FUZES.

Ten rounds were then fired with common shell (filled), and percussion fuzes, the circumstances being the same as above. The failure of the fuzes is also recorded here.

| Rounds. | Deviation after 1st Graze.          | Time of Flight between 1st and 2nd Grazes. | Rounds. | Deviation after 1st Graze. | Time of Flight between 1st and 2nd Grazes. |

| 3       | 6                          | $6\frac{1}{2}$                             |
| 4       | 3                          | $3\frac{1}{2}$                             |
| 5       | $2\frac{1}{2}$             | 3                                          |

The number and distance of the rebounds varied very much during the practice. Sometimes there was no second rebound, and at others several grazes were seen to strike at short distances apart.

## REMARKS.

The practice was very good for the elevation allowed; the shot were, however, falling short of the distance that was intended in the first place.

*Recoil*.—Moderate. The breeching was hitched to allow the gun to come in about 6 feet. After the 3rd round, two strands having gone in the nip of the clinch, the breeching was shifted. No undue strain was afterwards brought upon the breeching, which should have been 9-inch rope for a gun of this weight.

A 9-inch breeching was rove on the third day.

*Sponging* with the bristle sponge was heavy.

*Loading*.—3 and 4 rammed home with their feet bearing against the sweep piece; but the shot went home hand over hand, and without any check. Some little time was gained in each round at the first by not pricking the cartridge at this gun.

*Running out* was performed with great facility, on the first day especially, owing very much to the ship having  $\frac{3}{4}$  list towards the object; but it was not equal to the wedge gun in this respect, which had the five loading numbers less to man the side tackles, and not so far to travel.

The latter is also much lighter than the Whitworth gun.

*Pointing*, with one handspike, and without the aid of side tackles, was a little heavier work than with the shunt gun, in about the proportion of the respective weights.

The rear vent was choked at the 70th round. It was removed three times; on the first occasion to be cleared, on the second for the inspection of the Committee, and on the third for examination at the conclusion of the broadside practice.

On the first and last occasions it was found to have closed near its platinum end.

The extractor answered its purpose very well.

ABSTRACT from the REPORT of the SEA SERVICE TRIALS.

The Time was taken from the firing of the first Round to the firing of the last Round in each Series, striking the Average at the Conclusion by dividing by the Number of Rounds less One. Deductions only were made where delays occurred from mishaps totally unconnected with the System or Construction of the Guns. The Numbers for Accuracy are awarded according to the Method usually adopted in "EXCELLENT," from 0 to 3 for ELEVATION, from 0 to 3 for DIRECTION.

*November 15, 1864.*

| —                 | Rounds. | Remarks.                                                                                                                                                             |
|-------------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hit direct - -    | 1       | Burst (on the opposite side of lower deck after tearing fore bitts).                                                                                                 |
|                   | 2       | No burst (struck the near gunwale in a part much weakened by previous firing, resistance apparently insufficient for the fuze to act).                               |
|                   | 3       | Burst (close down on main deck, fracturing beam (in twain) and carline below, destroying the planks).                                                                |
|                   | 4       | Through both sides, and burst on striking the water 400 yards beyond.                                                                                                |
|                   | 5       | Burst } 1 burst 10 feet in, after passing through shelf piece on main deck, and destroyed a beam end.                                                                |
|                   | 6       | Burst } 1 burst in a square of fore hatchway, tearing away its larger portion.                                                                                       |
|                   | 7       | Burst } 1 burst 20 feet in, blowing up carlines and upper-deck planks.                                                                                               |
| Hit en ricochet - | 1       | Burst in the outer planking after striking water five yards short of ship.                                                                                           |
|                   |         | After the trials were over, Mr. Forrest, of the R.L.D., was sent by Col. Boxer* to say that the fuzes used for Whitworth shell were not those intended for ricochet. |

\* The Committee inquired into this matter and ascertained that the fuze which Colonel Boxer stated should have been used on this occasion was not referred to in any of the lists or drawings of ammunition forwarded to them, although it appears that it had been forwarded to Shoeburyness without their knowledge.

SEA SERVICE TRIALS—*continued.*

PRACTICE with COMMON SHELL and PERCUSSION FUZES, from the 70-pounder WHITWORTH GUN, mounted (on Naval Slide Carriage) on board the Gunboat "STORK," in PORTSMOUTH HARBOUR. Target, "ALFRED," wooden Frigate, distant 700 yards.

|             |                                                  |         |                                                                    | After this day's practice was over Mr. Forrest, from the Royal Laboratory Department, came on board and stated that the fuzes used were again not those to be fired—"en ricochet."* |                   |                   |                   |

\* These fuzes were selected by Mr. Forrest, who previous to the experiment informed the Committee that they were intended to be used "en ricochet."

MR. WHITWORTH'S PROGRAMME.

PRACTICE WITH RIFLED SPHERES.  
On board H.M.S. "Excellent."  
November 3, 1864.

Two rounds were fired with these projectiles, their weight 22 lbs., charge 10 lbs.  
First round.—Three were entered, numbered respectively, 1, 2, 3 (outside).  
Elevation 1°; distance of target, 500 yards; size of target 8 feet square.  
First graze { 2 shot, about 600 yards.  
                  1 shot, about 200 yards.  
                  ricochetting through target.  
1 of the above broke on firing.  
One of these shot or a fragment ricocheted outside the range posts, another a long way to the right.  
Second round.—One sphere only (No. 4.)  
Elevation 1° 35'; distance of target, 1,000 yards; size of target, 8 feet square.  
First graze, 1,050 yards and 10 yards left; ricochetting onwards in apparently a straight course.

November 30, 1864.  
SHOEBURYNESS.  
RIFLED SPHERES.  
3 rifled spheres.  
8 lbs. charge.  
500 yards range.  
9 feet target, floating.

The following experiment was carried on with the Whitworth 70-pounder gun, to show its capability of throwing rifled spheres, a junk wad was rammed home after the spheres:—  
1st Round.—One sphere fell 150 yards short, the other two spheres fell about 20 yards beyond and about three yards right and left of the target.  
2nd Round.—One sphere fell in line close over the target, the other two spheres fell about 10 yards short and about six yards right and left of target. Ricochet of spheres appeared to be in good line, and ranged from 1,000 to 2,000 yards.  
3rd Round.—Three spheres fell close round the target, one hit. Ricochet in good line, about 2,000 yards.  
4th Round.—Two spheres fell about 50 yards short and in line, the other sphere fell about 150 yards short and 30 yards to the left.  
5th Round.—Two spheres fell about 20 yards short and five yards to the left, the other sphere about 10 yards beyond and 50 yards to the right.

December 6, 1864.—SHOEBURYNESS.  
The gun was mounted on a standing carriage and elevated at 33° elevation.  
Common shell, 5 diameters long.  
The gun was laid by the clinometer.

PRACTICE WITH RIFLED SPHERES.  
On board H.M.S. "Stork" at Spithead.  
November 7, 1864.

Three rounds were fired en ricochet with the rifle spheres, three being entered at a time. (Weight of each, 18 lbs.); charge, 10 lbs.; elevation, &c., as before.  
One of the spheres in each round was apparently broken on discharge; the other two ranged about the same distance with respect to each other, but apart.  
Whitworth vent.—The cartridge was pricked for every round throughout to-day's practice.  
There were no "miss-fires;" but on looking through the vent it appeared to have slightly closed up.

December, 5, 1864.—SHOEBURYNESS.  
Charge, 10 lbs.  
Single rifled sphere, fired at a 9-foot target.  
RANGE, 1,000 yards.  
1st Round, 84 yards over, 1 yard left.  
2nd " 104 " line.  
3rd " 33 inches from centre of target.  
4th " 8 yards short, in line.  
5th " 114 yards over, 1 yard right.  
6th " 68 " 0.6 "  
7th " 69 " 1.2 "  
8th " 88 " 1.0 "  
9th " 40 inches from centre of target.  
10th " 48 " " "

RANGE, 1,500 yards.  
1st Round, 16 yards over, 8 yards left.  
2nd " 162 yards short, 10 "  
3rd " 64 " 8 "  
4th " 16 yards over, 8 "  
5th " 48 " short, 5 "  
6th " 20 " line.  
7th " 90 " 1 yard left.  
8th " 4 " 1 "

The gun was laid by Mr. Whitworth's man.  
November 24 :—Strong breeze down the range.  
" 25 :—Very light breeze.

# 70-PR. WHITWORTH SHOT. (FLAT-HEADED.)

## PENETRATION UNDER WATER.

PRACTICE from the "STORK" GUN BOAT, moored between 20 and 25 yards from the "ALFRED" frigate (oak built).

The "Alfred" was sunk so that her upper deck was almost flush with the water. Thickness of ship's side, 22 to 24 inches. The gun was depressed so as to strike the ship about two feet below the water line. A junk was placed outside the shot to prevent its shifting in the bore.

Weight. Shot - - 70 lbs. Length. 13.75 inches. Diameter at head. 4½ inches.

MR. WHITWORTH'S PROGRAMME—*continued.*

## IRON PLATES.

October 27, 1864.

Special Shell supplied by Mr. Whitworth.

Bursting charge,  $\frac{3}{4}$  lb.

RANGE, 400 yards.

Charge, 12 lbs.

1st Round.—Struck the Warrior target exactly on a hole made by a former shell (No. 2 Whitworth

at 50 yards), broke through the skin and broke the rib in rear, bent and distorted the rib to a distance of  $2\frac{1}{2}$  feet below the hole.

2nd Round.—Struck 2 ft.  $4\frac{1}{2}$  in. from the left edge of the target, buried itself its whole length and bulged the inside skin.

SHOEBURYNESSE, December 5, 1864.

Whitworth steel shells for 70-pounder gun, fired at "Warrior" target at 600 yards range.

These shells are flat-headed, 14·8 inches long, and of peculiar construction. A plug 4 inches long and 2·1 inches in diameter, is fitted tightly into the front of the shell, and the base is closed with a screw plug. A small spindle attached to this plug passes up the axis; it is hollow, and has a nipple in front, on which a percussion cap, which plays loosely in the interior, is intended to be set in action when the shell is arrested by the iron target. Several small holes at the base of the spindle allow the exit of the

flame from the cap. The bursting charge, viz., 1 lb. of powder, is placed in a bag and secured round the spindle, and ignited by the cap composition.

The intention of this arrangement is that the shell should act as a gun as soon as it has done its work of penetration, and so force the plug through the inner skin of the target.

Weight of shell, 74 lbs. 2 ozs. Length, 14·8".

Charge, 12 lbs. of large grain powder (L.G.)

Burster, 1 lb.

Length of plug, 4 inches. Diameter, 2·25".

1st Round, Trial flat-headed Shot, Cast Iron.

Struck the ground 11 yards short, and ricocheted on to the target sideways, making a slight dent, and breaking up.

2nd Round, Another Trial Shot of the same kind.

Struck 3 feet above the bull's-eye and about 2 feet from the top edge. Making a dent of about one inch deep, and then breaking up.

3rd Round, Steel Shell.

Struck 2 feet 8 inches from the top, 5 feet 8 inches from the left hand of plate, 2 inches below the indent caused by No 2. It entered the target and the burster was fired, the base of the shell 3·3 inches from the face of the plate. The plug was driven by the burster through the iron skin, carrying with it the portion of the plate struck and a large piece of the iron skin. No bolts were broken. The plug set up about  $\frac{1}{4}$  of an inch. This shell acted exactly as intended by Mr. Whitworth.

4th Round, Steel Shell.

Struck and left a hole 2 feet deep, at 14 inches from the top, and 3 feet 6 inches from the left-hand edge of the target, 3 inches from a securing bolt. Just in line with the edge of the timber supports, which are 20 inches square, the burster exploded; the piece of the plate and the plug of the shell were driven against the iron skin. The shell itself was driven out backwards a distance of 74 yards; the shell was set up about 1·8 inches. An iron rivet head was broken off and the skin slightly bulged.

5th Round, Steel Shell.

Struck 4 feet 6 inches from the top of target, on an old shot fired from the Whitworth 70-pounder, on June 24, 1864, at a range of 50 yards. The burster exploded and the shell broke up.

6th Round, Steel Shell.

Struck 3 feet 6 inches from the top and 5 feet 6 inches from the left edge of the target, 4 inches from the fracture caused by No. 5. The piece of the plate struck was driven against the skin. The burster exploded, driving out the plug and forcing the shell backwards a distance of 104 yards. The head was set up 2·3 inches.

The part of the target struck this round is backed by a vertical stringer.

COMMITTEE'S PROGRAMME.

LONG COMMON SHELL.

SHOEBURYNNESS.

Weight, 69 lbs., empty.

Diameter { major, 5.46 in.  
          minor, 4.98 in.

Length, 21 inches.  
Bursting charge, 5 lbs.  
Charge, 10 lbs.

The gun was fired from the rear vent.

## PRACTICE AGAINST IRON PLATES.

June 23, 1864.

The practice was carried on against a target 10 × 20 feet, representing a section of the "Warrior," supported at the back in the usual manner.

RANGE, 800 yards.

Charge, 12 lbs.

|                               |       |          |

| Diameter:—Major, 5.46 inches. |       |          |
| Minor, 4.98 inches.           |       |          |
| Number of the gun, 267.       |       |          |

1st Round—Shot.

Struck 4 feet 3 inches from the left edge, 4 feet from the bottom of the target; penetrated the plate; the shot broke off and part remained in the target; the depth in the backing could not be ascertained; damage in-board, one armour bolt broken off; left-hand bolt of plate slightly started.

2nd Round—Shot.

Penetrated the plate and remained bedded in the target its whole length; struck 8 feet from left edge and 6 feet from bottom of the target; the shot was cold.

3rd Round—Shell.

Struck 2 feet 9 inches from left edge and 2 feet  $8\frac{1}{2}$  inches from the bottom; made an indentation  $4\frac{1}{4}$  inches deep; exploded on the outside; drove the plate  $\frac{1}{2}$  an inch in; damage in-board, one rivet head broken.

June 24, 1864.

No. 267 gun.

RANGE, 50 yards.

1st Round—Shot.

Struck 9 feet 6 inches from left edge and 5 feet 4 inches from the bottom of the target; struck over horizontal stringer; the shot penetrated the plate and remained bedded in the target;  $2\frac{1}{2}$  inches of the base projected; the head of the shot set up and cracked; damage in-board, one bolt broken.

2nd Round—Shell.

Struck 2 feet 7 inches from the left edge and 3 feet 8 inches from the top edge of the target; the edge of the shell 1 inch from the join of two plates; shell penetrated the plate and broke up and fragments remained bedded  $6\frac{3}{4}$  inches in the target; plate driven back 1 inch and bent; left-hand end of plate started  $\frac{1}{4}$  inch from backing; damage in-board, one bolt broken.

RANGE, 600 yards.

1st Round—Shot.

Struck 10 feet 3 inches from left edge and 4 feet 7 inches from bottom;  $6\frac{1}{2}$  inches from the fracture caused by a former shot, and  $1\frac{1}{2}$  inches from the securing bolt; penetrated the plate and remained bedded in the target; 5 inches of the shot outside the plate; damage in-board, nil.

2nd Round—Shell.

Struck 7 feet 5 inches from right edge and 4 feet 4 inches from the bottom of the target, and 5 inches from the fracture caused by a former shell partially on a securing bolt; shell broke up; the fragments remained  $4\frac{1}{2}$  inches in the target; one crack extending from the bolt hole to a former fracture; damage in-board, two securing bolts broken.

June 27, 1864.

No. 267 gun.

RANGE, 200 yards.

1st Round—Shot.

Struck 5 feet  $2\frac{1}{2}$  inches from the right edge, 3 feet 6 inches from the bottom of the target, 6 inches from a securing bolt, and 6 inches from the former shot of the Armstrong gun; struck on the join of two plates; the shot stuck in the target, the base being  $4\frac{1}{2}$  inches outside the face of the plate; damage in-board, one backing and two securing bolts broken.

2nd Round—Shell.

Struck 5 feet  $7\frac{1}{2}$  inches from the left edge and 5 feet  $7\frac{1}{2}$  inches from the bottom of the target; the shell penetrated the plate and burst, some of the pieces remained bedded  $7\frac{1}{2}$  inches from the face of the plate; struck 3 inches from the Armstrong shot fired at 600 yards; no damage done to the bolts on the face; damage in-board, three backing bolts broken.

July 1, 1864.

RANGE, 50 yards.

Shell.

Struck 5 feet 9 inches from the left edge and 3 feet 3 inches from the bottom of the target; passed through the plate and burst; penetration, 18 inches; struck on the joint of the plates; one bolt started  $\frac{1}{4}$ th of an inch; damage in-board, skin bulged, three backing bolts and one armour bolt broken, one rib cracked.

## PRACTICE AGAINST ARMOUR PLATES PLACED AT AN ANGLE OF 52° FROM THE PERPENDICULAR.

---

*April 26, 1865.*

RANGE, 200 yards.

Charge 12 lbs.

Steel shot, flat end.

The plates made by Petit, Gaudin, and Co. were 15 feet by 3 feet 4 inches by  $4\frac{1}{2}$  inches, and were supported on strong wood frames at an angle of 52°.

### *1st Round.*

Struck in the centre of the plate 6 feet, 3 inches from the bottom, made an indent 15 inches long, 6 inches broad, and 3 inches deep. Plate bulged and cracked at back.

### *2nd Round.*

Struck 2 feet 3 inches from the bottom of the plate,

made an indent 12 inches long,  $6\frac{1}{2}$  inches broad, and  $2\frac{1}{2}$  inches deep; the plate was slightly bulged at the back, but not cracked.

Shot broke up.

### *3rd Round.*

To test the uniformity of the plates this round was fired at the plate previously struck by the Armstrong shot.

Struck 3 feet 2 inches from the bottom and in the centre of the plate.

Made an indent 11 inches long, 6 inches broad, and  $2\frac{3}{4}$  inches deep; the back of the plate was slightly bulged, but not cracked.

The shot broke up.

---

## RAPID FIRING.

*July 6, 1864.*

The gun was mounted on a rear chock carriage on an ordinary ground platform and worked by men of the Royal Artillery.

The detachments were changed every 20 rounds.

### *Solid Shot.*

| 5th    "           "              | - 22   "                  |
| 6th    "           "              | - 16   "                  |

The ordinary lubricator with cardboard hexagons on either side was used.

The usual bristle sponge was used.

This gun was loaded with very great ease throughout.

---

25 rounds, rapid firing, were fired with 12 lbs. charges.

---

# 70-POUNDER MUZZLE-LOADING ARMSTRONG GUN.

## EXPERIMENTS FOR DETERMINING RANGE AND ACCURACY.

N.B. The figures in *Italics* are the rounds struck out by the competitors as abnormal shots.

SHOT (HOLLOW HEADED.)

SHOEBURYNESS.

*Particulars of Gun.*  
 Weight, 75 cwt.  
 Length, 10 ft. 3.25 in.  
 Diameter of bore, 6.4 in.  
 Length of bore, 9 feet.  
 Grooves, No. 3.  
 Windage, 0.06 in.  
 Spiral, 1 turn in 256 inches, 40 calibres nearly.

*Particulars of Ammunition.*  
 Weight, 70.6 lbs.  
 Diameter, 6.34 in.  
 Length, 12.81 in.  
 No. of buttons, 15 in 3 rows.  
 Projection of buttons, .11 in.  
 Breadth of buttons at top, .45 in.  
 " " at bottom, .59 in.  
 Length of cartridge, 12 in.  
 Diameter of cartridge, 5 in.  
 Brand of powder, A 4.  
 Charge, 10 lbs.  
 Wad, Boxer's lubricator, filled with oil.

RANGE AND ACCURACY—*continued*.

## SEGMENT SHELL (WEIGHTED WITH SAND).

N.B.—The figures in *Italics* are the rounds struck out by the competitors as abnormal shots.

## PARTICULARS OF SHELL AND AMMUNITION.

SHOEBURYNESS.

Weight, 68·9 lbs.

Diameter, 6·34 in.

Length, 13·88 in.

No. of segments, 98.

Bursting charge, 3 lbs. for sea service, 1 lb. for land service.

No. of studs, 15 in three rows.

Breadth of studs at top, ·45 in.

" " bottom, ·59 in.

## SEGMENT SHELL.

December 20, 1864.

RANGE, 800 yards.

The shells were fired through screens 4" in thickness so as to burst the shell 100 yards in front of the 1st line of targets.

Three lines of 6 targets each, 10 yards apart.  
Bursting charge of shell, 1 lb.

## PENETRATION INTO MASONRY.

DESCRIPTION OF TOWER.—(See *Lithograph opposite*).

The Tower was built in the year 1804, and is stated to have cost 3,000*l*. It is of brick, able to accommodate 20 men, with magazine space for 80 barrels or 70 cases of powder. Like all the Martello Towers on this part of the coast, it is designed for one gun. The wall on the side fired at is 7 feet 6 inches thick at the level of the ground, and 5 feet 9 inches at the spring of the vault, which is 19 feet from the ground. It is 31 feet 6 inches high, but receives considerable support, at 12 feet above the ground, from the joists of the floor, which radiate from a central pillar and abutt against it. To a certain extent also the basement floor, at 2½ feet above the ground, may be regarded as a support. In appearance the Tower was perfectly sound, the brickwork having been protected by a coating of plaster. The parapet, 5½ feet high and 5 feet thick, was coped with Bramleyfall stone, in blocks containing 7 or 8 cubic feet; a step 2 feet high, round the interior, served the double purpose of a banquette and of a support for the front racers of a rear pivot-traversing platform turning the entire circle. The racer itself was laid on granite curb-stones of about half a ton weight each. Thus a great solidity characterised the whole structure. The roof was formed of a bomb-proof vault, supported in the centre by a pillar 4 feet in diameter, turned in three courses of bricks, and surmounted by an equal thickness of ordinary brickwork, giving altogether about 5 feet of masonry over the crown of the arch. The diameter of the whole at the top was 40 feet, and nearly 46 feet at the bottom.

*Bexhill, October 19, 1864.*

RANGE, 750 yards.

Right gun.

*1st Round—Common Shell, blind, filled with sand.*

Struck 5 feet left of door, 9 feet 6 inches below the floor line, just above the ground line; penetration, 2 feet 6 inches.

*2nd Round.*

Struck 6 feet 6 inches left of door and 5 feet below the floor line, in exactly the same relative position as the 1st round from the Whitworth gun; the shell passed through the wall, and was found inside unbroken.

*1st Round—Shot, hollow-headed.*

Struck over the granite arch of the platform racer-bed; penetration, 4 feet 7 inches into the upper solid part of tower.

*2nd Round.*

Struck 3 feet 2 inches above the top of the door and immediately over it, cut through a wrought-iron bar 1½ inch square; penetrated 3 feet, and knocked away the top of the door.

*3rd Round.*

Struck full on the solid part of the masonry; penetration, 4 feet 9 inches.

*October 20, 1864.*

COMMON SHELL PILLAR FUZES.

Bursting charge, 4½ lbs.

*1st Round.*

Struck a heap of stones and rubbish at the foot of the tower, and burst before reaching the wall.

*2nd Round.*

Shell penetrated 5 feet and burst; the brickwork on the face removed 4 feet × 4 feet to a mean depth of 2 feet; scaled the wall on the inside 5 feet × 4 feet × 9 inches; one hole 3 feet deep.

## COMMON CASE.

December 21, 1864.

RANGE, 500 yards.

At a line of six 9-foot targets.

## FUZES.

*December 21, 1864.*

The following experiment was carried on to ascertain whether the common wood fuze could be used with the muzzle-loading guns. 70-pounders; segment shell; charge, 10 lbs.

*Ordinary Lubricator.*

|           |                  |          |

ROUGH USAGE.

---

*June 22, 1865.*

M.L. 70-PR. ARMSTRONG.

To ascertain the effect of shot striking the gun, it was laid on skidding, and fired at with a 40-pr. Armstrong breech-loading gun at a range of 40 yards, with solid cast-iron shot.

*1st Round.*

The gun was laid with its muzzle pointing towards the 40-pr. at an angle of about  $20^{\circ}$  with the line of fire.

Struck 30 inches from the muzzle, made an indent, and dented the shoulder of the trunnion.

The interior of the bore was not damaged; a shot was rammed home.

*2nd Round.*

The gun was laid with its muzzle pointing towards the 40-pr. at an angle of about  $35^{\circ}$  with the line of fire.

Struck close to the last shot and made an indent, and cracked the exterior coil. Interior not damaged. A shot was rammed home.

*3rd Round.*

The gun was laid at angle  $85^{\circ}$ .

Hit on the junction of the two coils in front of the trunnions, cracked the front strengthening coil longitudinally and transversely, and the other transversely.

A shot was rammed home.

*4th Round.*

The gun was laid nearly broadside on its axis, being at  $85^{\circ}$  with the line of fire.

Struck at 46 inches from the muzzle, cracked both the tubes right round, rendering the gun unserviceable.

---

Thirty shot were thrown into a wagon and out again in a heap; this was repeated twice. The shot were subsequently fired without difficulty.

## SEA SERVICE TRIALS.

### EASE OF WORKING AS A BROADSIDE GUN.

The gun was mounted on a common truck carriage, having depression chock, bed, and elevating screw, and worked by a crew of 15 men.

The peculiarities appertaining to its fittings and stores, as differing from the land service, are as follows:—

*Sea Service patterns.*—Spill for friction tube with loop and half-cock cleat.

Quill friction tubes.

*Gun gear.*—8-inch breeching (rove through carriage brackets and hitched in the first place to allow a recoil of about six feet).

*Side tackles.*—Blocks 10-inch double for 3-inch falls.

No instrument had been supplied for extracting the charge until the 12th November 1864 (*see below.*)

A 9-inch breeching was rove on the third day.

The extractor, arrived November 12, 1864.

Three tumbler prongs with buttons made to fit over the head of the projectiles, where there are notches corresponding to the buttons; the prongs are made to close and grasp the projectile head by the action of a screw plate at the tumbler ends.

There is an elastic band round the tumbler ends to keep the prongs open.

The extractor is kept in position in the grooves by guides.

October 31, 1864.

#### INDEPENDENT FIRING.

Forty rounds in series of 20, the crew resting in the intervals.

Hollow-headed shot, 70·6 lbs.

Charge, 10 lbs.

Distance for which gun was laid, 2,600 yards (the target having been struck down by a shot from another gun, aim was taken for a pole standing in the range).

Elevation, 5° 30'.

Deflection, 0.

Wind,  ; force, 3.

In the first 20 rounds the intervals between the successive rounds were as follows:—

The Nos. awarded for accuracy are in italics.

| —     | Nos. | —     | Nos. | —     | Nos. | —     | Nos. |
|-------|------|-------|------|-------|------|-------|------|
| m. s. |      | m. s. |      | m. s. |      | m. s. |      |
| 0 0   | 0    | 0 59  | 4    | 0 54  | 4    | 1 5   | 4    |
| 1 0   | 4    | 1 21  | 5    | 1 0   | 4    | 1 1   | 6    |
| 0 55  | 6    | 1 2   | 5    | 0 50  | 5    | 0 45  | 6    |
| 0 51  | 5    | 1 3   | 5    | 1 10  | 6    | 0 55  | 4    |
| 3 50  | 4    | 1 0   | 4    | 1 30  | 6    | 0 50  | 4    |

After the fourth round, two strands having gone in the nip of the clinch, the breeching was shifted in three minutes.

At the 15th round the tube became unhooked, causing a delay of 10 seconds.

Towards the last few rounds the loading Nos. showed signs of fatigue.

Deducting three minutes, the time occupied in shifting breechings, and 10 seconds for the tube accident, the 20 rounds were fired in 18 minutes 41 seconds.

(Average time between each of the rounds, 59 seconds.)

The next 20 rounds were fired with the following intervals.

| —     | Nos. | —     | Nos. | —     | Nos. | —     | Nos. |
|-------|------|-------|------|-------|------|-------|------|
| m. s. |      | m. s. |      | m. s. |      | m. s. |      |
| 0 0   | 6    | 0 55  | 4    | 1 27  | 6    | 0 55  | 5    |
| 0 55  | 5    | 0 48  | 5    | 0 42  | 5    | 0 47  | 5    |
| 0 32  | 6    | 0 54  | 0    | 0 45  | 4    | 0 45  | 5    |
| 0 58  | 6    | 0 45  | 5    | 0 56  | 5    | 0 39  | 5    |
| 0 45  | 6    | 1 9   | 4    | 0 58  | 4    | 0 53  | 4    |

The elevation had to be corrected at the 11th round.

After the 14th round 3 and 5 exchanged places ;

the work of loading beginning to tell upon 3 and 4.

The 20 rounds were fired in 16 minutes 28 seconds.

(Average time between each of the rounds, 52 seconds.)

November 1, 1864.

Twelve rounds were fired for a comparison with the Whitworth 12 rounds of this date.

| —     | Nos. | —     | Nos. | —     | Nos. |
|-------|------|-------|------|-------|------|
| m. s. |      | m. s. |      | m. s. |      |
| 0 0   | 0    | 0 47  | 5    | 0 55  | 5    |
| 0 48  | 6    | 1 6   | 4    | 0 45  | 5    |
| 0 55  | 5    | 0 57  | 5    | 0 46  | 5    |
| 1 3   | 5    | 0 49  | 0    | 1 5   | 6    |

At the last round the powderman forgot to bring up the lubricator, delaying the gun 10 seconds.

Deducting this time, the 12 rounds were fired in 9 minutes 46 seconds.

(Average time between each of the rounds 53·3 seconds.)

The crew showed signs of fatigue towards the latter part of this practice, having fired previously in the course of about an hour,—

20 rounds from 8-inch gun,  
12 rounds from Whitworth gun.

EASE OF WORKING—*continued.*

October 31, 1864.

## QUICK FIRING.

Eighty rounds in series of 20 ; the crew resting in the intervals.

Shot, 70·6 lbs. Charge, 10 lbs.

5° 30' elevation was given on account of the danger attending ricochet in Portsmouth Harbour, and the direction also had to be brought on by the hand-spikes for the same reason.

In the first 20 rounds the intervals between the successive rounds were as follows :—

| m. | s. | m. | s. | m. | s. | m. | s. |
|----|----|----|----|----|----|----|----|
| 0  | 0  | *1 | 10 | 0  | 40 | *1 | 55 |
| 0  | 55 | 0  | 50 | 0  | 44 | 0  | 45 |
| *1 | 25 | 0  | 45 | 0  | 54 | 0  | 41 |
| 0  | 46 | 0  | 50 | 0  | 52 | 0  | 44 |
| 0  | 44 | 0  | 35 | 0  | 40 | 0  | 45 |

A delay of 15 seconds in loading for the third round, No. 3 having entered the studs into the shallow grooves ; this time is not deducted.

In loading for the sixth round the rammer head was broken.

Waiting for another rammer delayed the gun 10 seconds.

After the 14th round, 3 and 5 exchanged places, and after the 15th round, 4 and 6 exchanged places.

At the 15th round, the hook of the right side tackle was carried away, and in loading the cartridge burst at the choke ; shifting the side tackle, clearing away the broken cartridge, sweeping and wet swabbing the deck, delayed the gun 1 minute.

Deducting 1 minute 10 seconds for these mishaps, the 20 rounds were completed in 14 minutes 40 seconds.

(Average time between each of the rounds, 46·3 seconds.)

The next 20 rounds were performed with the following intervals of time :—

| m. | s. | m. | s. | m. | s. | m. | s. |
|----|----|----|----|----|----|----|----|
| 0  | 0  | 0  | 44 | 0  | 41 | *0 | 47 |
| 0  | 45 | 0  | 36 | 0  | 40 | 0  | 35 |
| 0  | 45 | 0  | 45 | 0  | 40 | 0  | 45 |
| 0  | 39 | 0  | 40 | 0  | 35 | 0  | 44 |
| 0  | 51 | 0  | 39 | 0  | 43 | 0  | 41 |

At the 15th round, the hook of the right side tackle carried away, the delay arising therefrom was 13 seconds.

Deducting this, the 20 rounds were fired in 13 minutes 2 seconds.

(Average time between each of the rounds, 41·3 seconds.)

November 2, 1864.

Twenty rounds were fired under the same circumstances as yesterday, except that a new 9-inch breeching had been rove, allowing 7 feet recoil.

Wind  ; force, 3.

| m. | s. | m. | s. | m. | s. | m. | s. |
|----|----|----|----|----|----|----|----|
| 0  | 0  | 0  | 30 | *0 | 42 | 0  | 29 |
| 0  | 35 | 0  | 28 | 0  | 41 | 0  | 31 |
| 0  | 29 | 0  | 36 | 0  | 32 | 0  | 31 |
| 0  | 40 | 0  | 30 | 0  | 26 | 0  | 30 |
| 0  | 30 | 0  | 30 | *0 | 35 | 0  | 29 |

Hook of left side tackle carried away at 10th round, delaying gun 10 seconds.

Hook of right side tackle carried away at 14th round, delaying gun 5 seconds.

Deducting 15 seconds, the time occupied in firing the 20 rounds was 9 minutes 59 seconds.

(Average time between each of the rounds, 31½ seconds.)

The loading Nos. were not changed as before. In loading for the 7th round, the shot hung at the muzzle a short time, evidently in a wrong groove.

November 3, 1864.

## QUICK FIRING, WITHOUT LUBRICATORS.

Twenty rounds were fired under the same circumstances as yesterday.

The breeching was hitched to allow 6 feet recoil.

Wind  ; force, 2 to 3.

| m. | s. | m. | s. | m. | s. | m. | s. |
|----|----|----|----|----|----|----|----|
| 0  | 0  | 0  | 28 | 0  | 33 | 0  | 28 |
| 0  | 31 | 0  | 36 | 0  | 29 | 0  | 32 |
| 0  | 32 | 0  | 30 | 0  | 33 | 0  | 29 |
| 0  | 37 | 0  | 51 | 0  | 29 | 0  | 30 |
| 0  | 28 | *0 | 30 | 0  | 29 | 0  | 30 |

At the 8th round, hook of right side tackle was carried away, delaying the gun 10 seconds.

Deducting this time, the 20 rounds were fired in 9 minutes 55 seconds.

(The average time between each of the rounds, 31·3 seconds.)

No difficulty was experienced in loading.

The gun was prevented in some measure from springing out again after the recoil, as the muzzle dropped by the reaction from "taut breeching," and took against the sweep piece until again freed by hauling on the train tackle.

At the conclusion of the firing the breeching had stretched out to about 7 feet 6 inches.

EASE OF WORKING (PIVOTING SLIDE CARRIAGE).

November 7, 1864.

FIRING AT SPITHEAD, EN RICOCHET.  
EMPTY SHELL.

Ten rounds were fired en ricochet, the gun being laid for the horizon with 1° elevation.  
Empty shell (common), 64½ lbs.  
Length of shell, 14·64 inches.  
Charge, 10 lbs.

The deviation after 1st graze is recorded below, and the "time of flight" between the 1st and 2nd grazes shows approximately the height to which the projectiles rose after striking the water, thus exhibiting the uncertainty of hitting the enemy "en ricochet."

| Rounds. | Deviation after 1st Graze. | Time of Flight between 1st and 2nd Grazes. | Rounds. | Deviation after 1st Graze. | Time of Flight between 1st and 2nd Grazes. |
|---------|----------------------------|--------------------------------------------|---------|----------------------------|--------------------------------------------|
|         | °                          | "                                          |         | °                          | "                                          |
| 1       | 3                          | 3½                                         | 6       | 1½                         | 8                                          |
| 2       | 2                          | 11¼                                        | 7       | 1½                         | 4                                          |
| 3       | 3                          | 6½                                         | 8       | 1½                         | 6                                          |
| 4       | 2½                         | 6                                          | 9       | 1½                         | 6                                          |
| 5       | 3                          | 4¾                                         | 10      | 5                          | Not taken, but a long time.                |

SHELL WITH PERCUSSION FUZES (experimental pillar).

Ten rounds were then fired with common shell (filled) and percussion fuzes, the circumstances being the same as above.  
The failure of a fuze is also recorded here.

| Rounds. | Deviation after 1st Graze. | Time of Flight between 1st and 2nd Grazes. | Rounds. | Deviation after 1st Graze.   | Time of Flight between 1st and 2nd Grazes. |

| 3       | Burst at muzzle.           |                                            | 8       | 1½                           | 5                                          |
| 4       |                            | 1                                          | 9       | 2                            | 7                                          |
| 5       | 1½                         | 4                                          | 10      | Not seen, but did not burst. |                                            |

SHELL WITH PERCUSSION FUZES:  
1 to 5 (service pillar), 6 to 10 (Pettman's).

Ten rounds were fired with common shell filled, the first five with the service pillar fuzes, the remainder with the service, Pettman's, fuzes for spherical shell; the conditions of elevation, &c. the same as before mentioned. The failure of the fuzes is also recorded here.

| Rounds. | Deviation after 1st Graze. | Time of Flight between 1st and 2nd Grazes. | Rounds. | Deviation after 1st Graze. | Time of Flight between 1st and 2nd Grazes. |

SHOT EN RICOCHET.

Five rounds with shot fired under the same conditions.

| Rounds. | Deviation after 1st Graze. | Time of Flight between 1st and 2nd Grazes. |
|---------|----------------------------|--------------------------------------------|
|         | °                          | "                                          |
| 1       | 5                          | 13½                                        |
| 2       | 5                          | 2½                                         |
| 3       | 9                          | 5¾                                         |
| 4       | 8                          | 4½                                         |
| 5       | 9                          | 4½                                         |

The number and distance of the rebounds varied very much during the practice; sometimes there was no second rebound, and at others several grazes were seen to strike at short distances apart.

REMARKS.

The practice was throughout the firing very good.  
Recoil, moderate.—Before commencing the firing the breeching was hitched to allow the gun to come in about 6 feet. After the fourth round, two strands having gone in the nip of the clinch, the breeching was shifted, and the gun then gradually closed up the hitch until, at the conclusion of the first day's firing, the breeching had straightened out to allow a recoil of 8 feet 4 inches.

The breeching should have been 9-inch rope for a gun of this weight.  
A 9-inch breeching was rove on the third day of the practice.

The loading.—The lubricators were too high. No. 4 had to thrust them in with the rammer to make room for entering the shot.  
3 and 4 rammed home with their feet bearing against the sweep piece, but the shot went home hand over hand and without any check.

Running out was performed with ease, especially on November 1st, when the ship had ¾ list towards the object, but it was not equal to the wedge gun in this respect, which had the five loading numbers less to man the side tackles and not so far to travel.

The latter is also about 14 cwt. lighter than the shunt gun.

Pointing, with one handspike and without the aid of side tackle, was no difficulty, but the work in this respect was greater than at the wedge in about the proportion of their respective weights.

SEA SERVICE TRIALS—*continued*.

PRACTICE with COMMON SHELL and PERCUSSION FUZES, from the 70-pounder M.L. ARMSTRONG GUN mounted (on Naval Slide Carriages) on board the Gunboat "STORK," in PORTSMOUTH HARBOUR. Target, "ALFRED," wooden Frigate, distant 700 yards.

## ABSTRACT from the REPORT of the SEA SERVICE TRIALS.

The Time was taken from the firing of the first Round to the firing of the last Round in each Series, striking the Average at the Conclusion by dividing by the Number of Rounds less One. Deductions only were made where delays occurred from mishaps totally unconnected with the System or Construction of the Guns. The Numbers for Accuracy are awarded according to the Method usually adopted in "EXCELLENT," from 0 to 3 for ELEVATION, from 0 to 3 for DIRECTION.

|                                                           |                                            | ARMSTRONG, M.L. ## PRACTICE AGAINST IRON PLATES.

*June 23, 1864.*

The practice was carried on against a target  $10 \times 20$  feet, representing a section of the "Warrior," supported at the back in the usual manner.

RANGE, 800 yards.

Charge, 14 lbs. ; for round shot, 18 lbs.

|                                        |     |          |

| Weight of steel elongated shot         | - - | 69 12    |
| Length, 9.9 inches.                    |     |          |
| Diameter, 6.3 inches.                  |     |          |
| Weight of steel elongated shell, empty | 68  | 7        |
| Bursting charge                        | - - | 2 0      |
| Length, 12.21 inches.                  |     |          |
| Diameter, 6.34 inches.                 |     |          |

Number of the gun, 60.

*1st Round—Elongated Shot.*

Struck 1 foot from the upper edge of the plate, and 7 feet 2 inches from left edge, on a securing bolt, broke the plate, and drove the fragments in 5 inches in depth ; shot bounded back without breaking up ; the shot shortened to 8 inches ; diameter increased to 6.8 inches ; damage in-board, nil.

*2nd Round—Elongated Shot.*

Hit on the left edge of the target, 9 inches from the top, passed through the plate and part of the backing ; the shot passed out sideways out to sea ; damage in-board, nil.

*3rd Round—Elongated Shell.*

Struck the lower plate 7 feet 6 inches from the left edge, 2 feet 1 inch from the bottom, and  $1\frac{1}{2}$  inches from a securing bolt ; depth of indent, 2.5 inches ; the charge of the shell burst ; the shell did not break up, and was found 400 yards in front of the target ; damage in-board, one armour bolt started .5 inches.

*June 24, 1864.*

No. 59 gun.

RANGE, 50 yards.

*1st Round—Round Shot.*

Struck  $5\frac{1}{2}$  feet from the bottom, 7 feet 8 inches from the right edge, and directly in the wake of horizontal stringer ; the shot broke up and remained embedded in the target 8 inches ; damage in-board, one armour bolt and one rivet broken.

*2nd Round—Elongated Shell.*

Struck 7 feet 7 inches from the right edge and 3 feet 4 inches from the bottom on the joining of two plates ; passed through the plate, driving in the fragments  $9\frac{1}{4}$  inches ; shell bounded back 20 yards without breaking up ; the bursting charge set fire to the backing ; one bucket of water sufficed to extinguish it ; the lower plate driven out half an inch ; nine

bolts in lower plate started forward  $1\frac{1}{2}$  inches each ; damage in-board, nine armour bolts and one backing bolt broken, and one armour bolt started.

No. 60 gun.

RANGE, 600 yards.

*1st Round—Elongated Shot.*

Struck 4 feet 6 inches from the left edge of the target, 5 feet from bottom, and 9 inches from a former fracture ; shot buried itself in the target, 1 inch of the base projecting ; damage in-board, nil.

*2nd Round—Shell.*

Struck 3 feet 3 inches from the right edge and 2 feet 8 inches from the bottom of the target ; bursting charge ignited ; depth of indent,  $1\frac{1}{2}$  inches ; damage in-board, several bolts slightly started.

*June 27, 1864.*

No. 60 gun.

RANGE, 200 yards.

*1st Round—Elongated Shot.*

Struck 5 feet  $4\frac{1}{2}$  inches from the right edge and 2 feet  $3\frac{1}{2}$  inches from the bottom of the target, and 3 inches from a bolt hole ; penetrated the plate and buried itself in the backing ; the base of the shot was 8 inches inside the face of the plate ; damage in-board, the skin was slightly bulged in the wake of the blow.

*2nd Round—Elongated Shell.*

Struck 6 feet 4 inches from the right edge and 3 feet  $2\frac{1}{2}$  inches from the top of the target on the joint of two plates ; 12 securing bolts were drawn from 1 to  $1\frac{1}{2}$  inches and one bolt broken off and thrown to the front ; the upper plate started  $1\frac{3}{4}$  inches from the backing at the right end ; the timber in the wake of the blow drawn upwards 1 inch ; damage in-board, seven securing bolts broken, one backing bolt broken, and one started ; the shell penetrated 6.4 inches from the face and was thrown back 30 yards ; the charge exploded, but did not break the shell.

*July 1, 1864.*

RANGE, 50 yards.

*Elongated Shot.*

Struck 6 feet 8 inches from the left edge and 5 feet 6 inches from the bottom of the target ; shot passed through the plate, the base being about 3.7 inches inside the face of the plate ; the shot struck immediately over the horizontal stringer ; damage in-board skin bulged and slightly cracked, two backing bolts broken ; one rib cracked.

## PRACTICE AGAINST ARMOUR PLATES PLACED AT AN ANGLE OF 52° FROM THE PERPENDICULAR.

*April 26, 1865.*

RANGE, 200 yards.

Charge, 14 lbs. ; steel shot, round end.

The plates made by Petit, Gaudin, & Co., were 15 feet by 3 feet 4 inches by  $4\frac{1}{2}$  inches, and were supported on strong wooden frames at 52°.

*1st Round.*

Struck 3 feet 7 inches from the bottom, and in centre of plate, made an indent 15 inches long and 7 inches broad, and a hole about 2 inches square through the plate. Two large pieces were torn off the back of the plate, and driven to the rear, another piece of the plate bent back.

Shot broke up.

*2nd Round.*

Struck 6 inches from the edge of the plate, made an indent 14 inches long,  $4\frac{1}{2}$  inches deep, and  $6\frac{3}{4}$  inches broad ; plate cracked through, and opened out at back ; a large piece of the back torn off.

Shot broke up.

*3rd Round.*

To test the uniformity of the plates, this round was fired at the plate previously struck by the Whitworth shot.

Struck  $9\frac{1}{2}$  inches from the edge of the plate, and 11 feet 2 inches from the bottom ; made an indent 14 inches long, 7 inches broad, and  $5\frac{1}{2}$  inches deep.

The back of the plate bulged and cracked through in several places across the indent ; a large piece of the back torn off.

Shot broke up.

## RAPID FIRING.

*July 6, 1864.*

The gun was mounted on a rear chock carriage on an ordinary ground platform and worked by men of the Royal Artillery.

The detachments were changed every 20 rounds.

*Shot.*

The 1st 20 rounds were fired in 27 minutes.

At the 17th round the shot stuck, and required 37 blows to drive it home; six men were at the rammer. The sponge was wetted at the 18th round.

|                                 |     |       |
|---------------------------------|-----|-------|
| The 2nd 20 rounds were fired in | 23½ | "     |
| 3rd                             | "   | " 24  |
| 4th                             | "   | " 18½ |
| 5th                             | "   | " 19  |
| 6th                             | "   | " 20½ |

Water was used throughout the experiment after the 17th round; three buckets full were used for the 120 rounds.

A sponge with a spring scraper was used throughout.

The use of the above was attended with great labour to the men.

The shot were high gauge and were difficult to ram home.

25 rounds with 14-lb. charges were fired as rapidly as possible.

## SIR W. ARMSTRONG'S PROGRAMME.

# FIRST SERIES.—70-POUNDER WEDGE BREECH-LOADING ARMSTRONG.

## EXPERIMENTS FOR DETERMINING RANGE AND ACCURACY.

### SHOT (HOLLOW-HEADED).

SHOEBURYNNESS.

*Ordnance.*  
 Weight, 61·6 cwt.  
 Length, 9 ft. 2 in.  
 Diameter of bore, 6·405 in.  
 Length of bore, 9 ft. 2 in.  
 Grooves { No. 70.  
           { Width, 0·175 in.  
           { Depth, 0·85 in.  
 Spiral, 1 in 37 calibres.

*Projectile and Ammunition.*

Weight, 71½ lbs.  
 Diameter, 6·43 in.  
 Length, 12·26 in.  
 Length of cartridge, 12 in.  
 Diameter of cartridge, 5 in.  
 Brand of powder, A 4.  
 Charge, 9 lbs  
 Wad, service lubricator.

# FIRST SERIES.—70-POUNDER WHITWORTH.

## EXPERIMENTS TO DETERMINE RANGE AND ACCURACY.

### SOLID SHOT.

SHOEBURYNESS.

*Ordinance.*  
 Weight, 77 cwt. 1 qr.  
 Length, 2 ft. 10·5 in.  
 Diameter of circle { circums<sup>d</sup>. 5·53 in.  
                               ins<sup>d</sup>. 5·03 in.  
 Length of bore, 9 feet.  
 Spiral, 1 in 18·0831 calibres.

*Projectile and Ammunition.*  
 Weight, 70 lbs. 1½ oz.  
 Diameter { major, 5·46 in.  
               minor, 4·98 in.  
 Length, 15·04 in.  
 Length of cartridge, 16·5 in.  
 Diameter of cartridge, 4·85 in.  
 Brand of powder, A4.  
 Charge, 10 lbs.  
 Wad, lubricator, Boxer's, filled with oil.

The gun was vented in the ordinary manner.

## RANGE AND ACCURACY—continued.

## COMMON SHELL.

SHOEBURYNESS.

*Projectile and Ammunition.*

Nature, common shell.

Weight,  $49\frac{1}{2}$  lbs.

Diameter, major, 5.46 inches.

Diameter, minor, 4.98 inches.

Length; 15 inches.

Bursting charge, 2 lbs. 8 oz.

RANGE AND ACCURACY—*continued.*

## BOXER'S SHRAPNEL SHELL.

SHOEBURYNESS.

*Projectile and Ammunition.*

Nature, shrapnel shell (Boxer's).  
 Weight, 67 lbs. 5 oz.  
 Diameter, major, 5'46 inches.

Diameter, minor, 4'98 inches.  
 Length, 15'46.  
 Bursting charge, 1 or 3 oz.

The firing was stopped on Sept. 13th, after two rounds had been fired, owing to the vent being choked up. Eighty-seven rounds had been fired from the vent.

# FIRST SERIES.—70-POUNDER MUZZLE-LOADING ARMSTRONG.

## EXPERIMENTS FOR DETERMINING RANGE AND ACCURACY. SHOT (HOLLOW HEADED).

SHOEBURYNESS.

### Ordnance.

Weight, 75 cwt.  
Length, 10 ft. 3.25 in.  
Diameter of bore, 6.4 in.  
Length of bore, 9 ft.  
Grooves, No. 3.  
Windage, 0.06 in.  
Spiral, 1 turn in 256 in.,  
40 calibres, nearly.

### Projectile and Ammunition.

Weight, 70.6 lbs.  
Diameter, 6.34 in.  
Length, 12.81 in.  
No. of buttons, 15, in 3 rows.  
Projection of buttons, .11 in.  
Breadth of buttons at top,  
.45 in.

Breadth of buttons at bottom,  
.59 in.  
Length of cartridge, 12 in.  
Diameter, 5 in.  
Brand of powder, A4.  
Charge, 10 lbs.  
Wad, Boxer's lubricator, filled  
with oil.

RANGE AND ACCURACY—*continued.*

## COMMON SHELL (WEIGHTED WITH SAND).

SHOEBURYNESS.

*Particulars of Shell and Ammunition.*

Weight, 69.75 lbs.

Diameter, 6.34 in.

Length, 14.64 in.

Bursting charge, 4.75 lbs.

No. of studs, 18 in 3 rows.

Breadth of studs at top, .45 in.

" " " bottom, .59 in.

## RANGE AND ACCURACY—continued.

## SEGMENT SHELL (WEIGHTED WITH SAND).

SHOEBURYNESS

*Particulars of Shell and Ammunition.*

Weight, 68·9 lbs.  
Diameter, 6'34 in.  
Length, 13'88 in.  
No. of segments, 98.

Bursting charge, 1 lb.  
No. of studs, 15, in 3 rows.  
Breadth of do. at top, ·45 in.  
Do. at bottom, ·59 in.

## DESTRUCTIVE EFFECT.

## SEGMENT SHELL FIRED TO BURST ON GRAZE.

November 14, 1864.

RANGE, 800 yards.

*Note.*—This practice was carried on with the 3 lb. burster, which Sir W. Asmstrong intended only for sea service, Sir W. Armstrong not having specified a reduced bursting charge for land service.

Firing carried on against three lines of 2-inch targets 9 feet square, six targets in each line, 10 yards interval between the lines. In the marsh.

SIR, O.S. Committee, 7th February 1865.

WITH reference to your letter dated 22/12/64, and subsequent instructions received from the President of the Ordnance Select Committee, I have the honour to submit the accompanying abstracts for the information of the Special Committee on Armstrong and Whitworth Guns.

1. These abstracts show the results of experiments made to determine the initial and remaining velocities of various projectiles fired with different charges from the competitive Armstrong and Whitworth 70-pounder guns.

2. The experiments took place at Shoeburyness on the 2nd, 3rd, 4th, 5th, and 6th of January 1865, and were carried out by means of Navez's electro-ballistic apparatus.

Two of these instruments were simultaneously employed in the investigations, and the velocity of each shot was observed at two points in the trajectory, one near the muzzle of the gun, the other at some distance from it. The practice was continued until five good observations were obtained with each charge and nature of projectile; and the mean loss of velocity which the shot experienced in passing over the space included between the two points was thus ascertained.

3. All the guns were charged and fired under the same circumstances, and a table (VII.) has been prepared giving the actual atmospherical state on each day during the experiments.

4. The projectiles used were solid shot, shrapnel or segment shell, and common shell. The shells were weighted up with sand and plugged.

5. The velocities of the projectiles were observed at the respective distances of 40 and 500 yards from the muzzle.

6. All the guns used lubricating wads throughout, except during a special experiment made to ascertain the effect of firing the breech-loading Armstrong 70-pounder without lubricators.

7. The Armstrong guns used the ordinary cartridge made up with serge bag. A special cartridge was used with the Whitworth gun.

This gun was vented in rear in prolongation of the axis of the bore; and the cartridge was made up in serge, and was provided with a paper tube containing quick match, which was inserted in the middle of the cartridge, so as to conduct the flame from the friction tube to near the centre of the mass of powder constituting the charge. The length of the paper tube was about 6·8 inches, the Whitworth cartridges were therefore ignited at a point 6·8 inches from the bottom of the bore.

The flame from the friction tube ignited the Armstrong cartridges through the vent in the following manner:—

70-pounder muzzle loader, 6·5 inches from end of bore.  
70-pounder breech loader, 4·5 inches from end of bore.

8. Table I. gives the mean results of the whole experiment.

Table II. gives the comparative mean results of the muzzle-loading guns, deduced from Table I.

From this table it appears that the initial velocities of the Armstrong solid shot with 12 and 10 lbs. are respectively 1,500 and 1,336 feet, while with the same charges the Whitworth shot are 1,395 and 1,338 feet.

With a charge of 12 lbs., therefore, the initial velocity of the Armstrong shot exceeds that of the Whitworth by 105 feet, and with a charge of 10 lbs. the Whitworth exceeds the Armstrong by 2 feet.

The initial velocities of the other projectiles are in much the same ratio, that is to say, the Armstrong gun is the best with 12 lbs., and the Whitworth with 10 lbs. This

seems to indicate that 12 lbs. is more powder than the Whitworth 70-pounder can burn with advantage.

And from Table I. it will be seen that 14 lbs. is more powder than the Armstrong 70-pounder can use with advantage.

The use of a tube in the Whitworth cartridge has contributed greatly to the favourable results which have been obtained. Indeed, this form of cartridge probably gives a greater velocity than the plan of venting the gun so as to strike the cartridge in the centre.

In an experiment carried out with a 70-pounder Whitworth gun for the Ordnance Select Committee in 1862, the initial velocity of a shot of 69 lbs., with charge 10 lbs., was 1,204 feet, where the cartridge was ignited close to the rear.

Igniting in the centre has therefore increased the velocity by more than 100 feet.

This method of igniting the cartridge in the centre by means of a tube communicating with the rear, appears to have originated with the late Captain Lyons, R.A., while Inspector of Artillery.

His experiments were carried out at the Proof Butt, Woolwich, in connexion with the proof of ordnance, and are detailed by him in a report to the Ordnance Select Committee, dated 13/5/62, Minute 6584, 61/I. of Art./241.

9. As might be expected from its smaller sectional area, the Whitworth shot experiences a less resistance than the Armstrong.

Thus the loss experienced by the Armstrong solid shot with 10 lbs. charge, in passing over 460 yards of air, was 128 feet, while under the same circumstances the Whitworth shot lost 86 feet, showing a difference in favour of the latter of 42 feet.

The other projectiles are in much the same ratio, that is to say, the Whitworth projectiles invariably lose less velocity than the corresponding Armstrong projectiles, although the actual amount of difference varies according to the velocity, weight, and shape of the projectile.

Thus with the Armstrong muzzle-loading projectiles, the common and segment shells lose slightly less velocity than the solid shot with the lowest charge, probably owing to some difference in their form of head.

10. It appears that when the breech-loading Armstrong gun is fired without lubricating wads, there is a slight diminution in the velocity of the projectile; thus, the initial velocity of the solid shot from this gun is 1,163 when lubricating wads are used, and 1,137 without these wads.

11. The powder used in this practice with all the 70-pounder guns was slightly weaker than that employed with the 12-pounder guns in the experiments alluded to in my report 11/6/64.

This is shown by the velocity given by the standard Armstrong 12-pounder, Table VI. The initial velocity here given is 1,199 feet, while in the case of the 12-pounder experiments it was 1,238·8 feet. This slight difference in strength is constantly met with in practice with different lots of A 4 powder.

12. Tables III., IV., V., and VI. give the separate results of each shot, with a description of the several guns employed.

Table VII. gives the atmospherical state during the practice.

I have, &c.

Standard weight of one cubic foot of air at 60° Fahr. and pressure of 30 inches, saturation being 0·5 = 534·3 gra.

Ordnance Select Committee,  
Royal Arsenal, Woolwich, S.E.,  
8th March 1865.

Sir,

With reference to my letter, dated 11th February 1865, and your minute thereon, I have the honour to enclose the accompanying abstracts for the information of the Special Committee on Armstrong and Whitworth Guns.

These abstracts show the results of experiments to determine the velocity of shot fired from the 70-pr. competitive guns with different brands of powder, viz., L. G. and rifle L. G. (A 4), and further to ascertain what effect the centre igniting

tube, in the Whitworth cartridge, has on the velocity of the projectile.

It appears that the use of L. G. powder is attended by a diminution in velocity in all cases except with the 70-pr. B. L. Armstrong gun, and that firing the Whitworth cartridge, without tube, through the rear vent has the effect of reducing the initial velocity by about 100 feet.

I have, &c.

(Signed) WM. H. NOBLE, Lieut. R.A.,  
The Secretary, Special Committee, Associate Member,  
Armstrong and Whitworth Guns. O.S. Committee.

TABLE showing the INITIAL VELOCITY of ELONGATED SHOT fired from the 70-PR. COMPETITIVE ARMSTRONG and WHITWORTH GUNS with different Brands of Powder and under various circumstances.

# INDEX AND ANALYTICAL DIGEST OF EVIDENCE.

N.B.—The Numbers inserted after the word *App.* indicate the page to which reference is made, while the other Numbers refer to the questions in the evidence.

## INDEX TO 12-PR. EXPERIMENTS.

### A.

#### ACCIDENTS:

Evidence of several witnesses to accidents with vent-pieces in Armstrong guns, when of the old pattern, or without the projecting strengthened back; *Cox, S.* 251. 255. 342; *Cox, J.* 433. 450-466; *Liddell* 986. 995; *Bechervaise* 1224-1244; *Milward* 1359; *Harrison, A.* 1426; *Taylor* 1555; *Hewlett* 2134; *Powell* 2228; *Anderson* 2514. 2529; *Gardner* 2640. 2659. Injury to eight men in H.M.S. "Harrier's," pinnace off New Zealand, by vent-piece of 12-pr. Armstrong; *Seymour*, 1995. Bursting of 150-pr. Armstrong gun; *Taylor* 1555. Bursting of Whitworth guns; *Gordon* 1760; *Hewlett* 2051. 2068-2076; *Noble* 3468-3471; *Whitworth* 3876-3891. Accident in the "Stork" gun-boat by the explosion of shell; *Liddell* 1019. Pillar fuze liable to cause accidents; *Boxer* 1725; *Bent* 2759. Explosion of a pillar fuze in store department, Woolwich; *Gordon* 1812.

#### ACCURACY:

Evidence of the great accuracy of the Armstrong gun; *Cox, S.* 231; *Cox, J.* 415; *Alderson* 580; *Milman* 763; *Liddell* 947; *Bechervaise* 1201; *Milward* 1331; *Boxer* 1621; *Rice* 1904; *Hewlett* 2049; *Powell* 2269; *Gardner* 2603. Accuracy comparatively unimportant for naval ordnance; *Rice* 1940; *Glyn* 1984; *Hewlett* 2091. Exception taken to the accuracy of the Armstrong gun; *Seymour* 1993. 1996. 1998. 2022; *Gardner* 2701. The 20-pr. naval Armstrong gun not as accurate as the other natures; *Bechervaise* 1203. Corrections possible by the eye for accuracy at 3,000 yards' range for distances not under 200 yards; *Milman* 732. Evidence of the extreme accuracy of the Whitworth guns; *Alderson* 623; *Milman* 736-768; *Boxer* 1621; *Hewlett* 2051; *Gardner* 2731. Accuracy of the shunt gun; *Milman* 813.

#### ADAPTER, FUZE:

Objection to; *Bechervaise* 1292. Opinion favourable to; *Milman* 933. The price of the adapter placed at 6d. and statement that it is not a peculiarity of the Armstrong gun; *Noble* 3678, 3679.

#### ALDERSON, CAPTAIN HENRY JAMES, R.A. (*Analysis of evidence.*)

Is assistant-superintendent of experiments at Shoeburyness. Thinks the Armstrong gun precise at all ranges; 580. Prefers muzzle loaders, if equal to the Armstrongs, for field purposes; 584. The vent-piece the weak point; 587. Considers injury to the breech screw caused by flaws, or carelessness of the men; 591. Does not like side loading for field guns; 596. The male screw of the breech screw generally injured; 603. The 12-pr. Armstrong, when used as case shot, effective as 24-pr. howitzers at 300 yards; 604. For a field battery would prefer four 12-pr. Armstrongs and two short 20-prs.; 605. Prefers the Armstrong 12-pr. to the Whitworth; 615. Believes a shell bursting in the Whitworth brass gun would render it unserviceable; 616. Armstrong gun not thus disabled; 618. Has seen shell jam in the bore of a Whitworth gun; 619. The Whitworth gun is equal to the Armstrong in accuracy and facility of working; 623. At a distance of about 30 yards from a column the Armstrong shell would spread about 30 yards; 627. Thinks the 12-pr. should be shortened; 634. No difficulty from the alteration of form in the Armstrong projectiles; 637. The recoil of the Armstrong gun sharp and more than the smooth bore; 639. In some cases prefers the heavy guns as breech loaders; 646. Working 110-pr. more severe on men than the 68-pr.; 648. Has seen breech screws of heavy guns damaged by vent-piece breaking; stripping will not occur to projectiles with careful loading; 653. The shunt as a principle appears to answer; 655. Believes the new time and concussion fuzes remedy the faults of the old; 659.

Nothing under 300- or 600-prs. would do any real harm to an iron-plated ship; 662. The Whitworth has beaten the Armstrong gun in penetration, but is ineffectual for real damage; 663. Penetration a question of material in the projectile; 666. Has seen successful experiments with 40- and 110-pr. shells filled with molten iron; 673. Recommends elongated projectiles for plunging, but not for ricochet fire; 680. The converted carriages sometimes break with 12-pr. Armstrongs; 688. For ordinary purposes prefers muzzle loaders from their requiring less care; but likes 40-pr. screw gun for siege purposes, and the heavier breech loaders for casemates; 690. Has seen Armstrong guns which were very dirty cleaned and ready to fire in five minutes; 699. Shells bursting in Armstrong guns burr the grooves, but do not injure the accuracy of fire; 702. The ranges of Whitworth and Armstrong 12-prs. with equal charges would be about the same; 707. The latest pattern of fuzes and segment shell are very good; 710. Segment shells fired from field guns are most formidable; 711. Great want of shell gun in field batteries; 713. Pillar fuze effective against wooden ships; 720. The coil system an element of great confidence in the construction of guns; 721.

#### ALTERATION OF PATTERNS:

For the trial of the Armstrong system, Sir W. Armstrong proposes to bring before the Armstrong and Whitworth Committee guns into which all the latest alterations have been introduced; *Armstrong* 118. Proposes muzzle-loading shunt field gun; *ib.* 122. The wedge gun with alterations from its original construction; *ib.* 126-128. Alterations to fuze. *ib.* 161. Toughening vent-pieces in oil and altering form; *ib.* 207. 211-213. 217; *Anderson* 2534. 3018-3043. Alteration to breech screw; *Armstrong* 215; *Anderson* 2398, 2399. The very serious results arising from the frequent change of the Armstrong gun stores, and the impossibility in the present state of things of maintaining a correct supply of stores; *Gordon* 1758. 1797-1805, 1806-1810. Evidence states that the danger of shot sticking in the bores of the Whitworth guns has been obviated by increased windage; *Whitworth* 84. The form of the shrapnel for the Whitworth gun is being determined by Colonel Boxer; *ib.* 114, 115. Alteration in the mode of forging breech pieces for Armstrong guns; *Anderson* 2386-2389. Detail of alteration in the manufacture of Armstrong guns generally; *Anderson* 2397-2401. 2449, 2450. 2499-2506.

#### AMMUNITION:

Witness does not propose any alteration in the mode of carrying ammunition from the method already in the service for field artillery; *Whitworth* 110, 111. Evidence of ammunition that had travelled a number of miles without injury; *Cox, S.* 317. Statement of the injury done to projectiles by travelling; *Gordon* 1819-1822; *Gardner* 2627. 2668, 2669; *Noble* 3642. Ammunition damaged in the limber boxes on the passage to China; *Milward* 1316. No complaints against the Armstrong ammunition but the stripping of the shot; *Glyn* 1971, 1972. The ammunition for the shunt gun slightly cheaper than that for the breech loader; *Noble* 3652.

#### ANDERSON, JOHN, Esq. (*Analysis of evidence.*)

Holds the position of assistant-superintendent of the Royal Gun Factories at Woolwich, and has been conducting those works for the last four years as regards management; 2327. Cast iron, as a gun metal, has many good points; its great defect is uncertainty; is good for resisting compression, but is defective in tenacity, and requires great weight of it to produce guns of proper strength; 2329. Thinks that if hooping were applied, that the defects of cast iron might be got over; cast iron has not been properly applied, but still there are better metals for selec-

tion; 2333. Bronze is an excellent metal, more tenacious than cast iron, but it is also softer; it is, however, a trusty metal from its uniform strength, while wrought iron is uncertain in the welds, becoming more so when the iron is of higher quality, or if the coal used is impregnated with sulphur; 2335. The Austrian metal almost the same as Muntz's, which has been found to fail as a gun metal owing to the zinc melting out; 2340. Sudden cooling of the Austrian metal increases its tenacity; 2342. When the manufacture by the "coil" principle first began, believed that the gun was as strong in the direction of the bore as it was laterally; but found it not so, in the proportion of 10 to 25 tons per square inch; with small coils there is not rigidity enough to receive a good blow in welding; 2350. To get a good gun pure iron is required, and the purer the iron the more difficult it is to weld; it is therefore difficult to make the insides free from defect. A solid inner tube was tried and found to answer; 2351. This inner tube was made from three slabs welded and drawn out, and then bored; its strength is about 22 tons; 2353. This plan was objected to for the 100-prs., as they were said to score, but that was nothing to the mischief caused by the opening of the welds in the coiled barrels; 2356. Coiled barrels not satisfactory; 2359. The loss of circumferential strength of the solid barrel, compared to the coiled one is as 22 tons to 25 or 26 tons; but in the longitudinal direction there is a gain of 10 tons in favour of the solid. Out of 255 12-pr. guns, at first proof, only three failed with the solid barrels; 2363. Out of 360 with the coiled barrels, had to renew the barrels of 160, which was a difficult work; 2366. The welds where two cylinders are brought together are stronger than the coils themselves if properly made; 2373. Considers the coil principle very safe for the outside of a gun; 2377. Prefers a good stiff bar that will bear a blow for making a coil; 2380. A large forging of wrought iron will not answer for guns; 2382. By the coil principle it is possible to obtain an iron of good quality, and trustworthy; 2383. The breech pieces were first made of two shells welded together, which was not sound, only giving a strength of 10 tons; 2388. They were afterwards made of a solid forging, increasing the strength to 22 tons; 2389. Out of 202 20-prs., with solid inner tube, none have been returned for repair, and from 239 110-prs. eight have been sent for repair; 2395. Five points of difference in the superiority of the new sea service 12-prs. over the old pattern with coiled barrel. The breech screw a great point of weakness, the new pattern thread of which is 20 to 25 per cent. stronger than the square thread; 2398. For land and sea service, 625 12-prs. have been made at the gun factories, and not more than 65 at Elswick; 2404. Considers a perfect 12-pr. should have a steel lining, and an addition to the breech screw; 2409. Recommends dependence for strength and safety on the coils outside the gun, while steel should only be used with discretion for the inside. Would not venture upon steel for an entire gun; 2412. A steel lining to a gun gives the advantage of a perfect and hard inside, and will not be injured much by shells, and gives a uniform strength, longitudinally and circumferentially; 2419. In a comparison between a solid forged and a built-up gun, the latter would be the best; 2432. There is much difficulty in forging the breech piece for the 70-pr. Armstrong wedge gun owing to the hole in it being limited to five inches; 2433. Coiled guns give great facility for inspection during manufacture—solid forged guns do not; if the latter were to burst they would do so without warning; 2444. The Horse Artillery 9-pr. made of a thickish coil, and gives a strength of 14 tons, and is better than the original 12-pr. A good many of them failed in proof from having spots in the bore, and had new barrels put in; 2450. Sir William Armstrong never liked the solid inner barrel system; 2459. Does not consider that the friction from hard metal surfaces of the shot will ever wear out a gun; it depends upon the amount of bearing surface, and does not anticipate injury to the Whitworth form of bore from this cause; 2473. Is of opinion that the form of rifling a gun has little effect on its bursting tendency; 2477. Prefers a uniform to an accelerating twist in rifling; 2487. Does not approve of the plugged up barrel plan for 300-pr.; prefers the tube solid and supported behind with a screw, or, better still, with a solid forged breech piece; 2488. Mr. Whitworth's 120-pr. made

in the gun factories had a forged iron barrel with a solid end; 2490. In the coil gun it is a matter of judicious arrangement of the joints, whether the gun is good or bad; 2499. Witness describes different modes of construction; 2500. Nothing can be worse than proving guns with too heavy charges; 2501. Does not approve of the breech-loading principle; 2506. The 12-pr. breech-loading Armstrong gun is about as good a gun of its kind as can be made, but it has many faults. Does not think the breech screw strong enough, and if the vent-piece is not heavy it will break; the copper bushing is liable to injury; 2514. The vent-pieces are made of steel at Sheffield; 2526. The breech screw not being home on the vent-piece renders the latter liable to break; 2529. The vent-pieces of Swedish iron do not break as readily as steel; but on tempering steel vent pieces in oil, found they stood a very severe proof; 2534. Does not remember that the fracture of the vent piece or breech screw has ever caused injury to the gun; 2542. Agrees with Colonel Taylor's commercial method of estimating the value of a gun; 2545. The amount of tools to be carried for the repair of large guns is formidable; the work has to be done with great accuracy, and the tools could not be done without; 2552. The wedge system does not offer the same facility for repairs as the screw breech loader; 2558. Nothing done yet to call forth the powers of the wedge gun; 2582. Would not recommend the shunt form of rifling; 2584. In the shunt portion of the gun the shot at a high velocity has to do more work, requiring a conformity of fit in gun and projectile equal to the occasion; 2593. Thinks that any incline will cause a shot to twist to a centre in leaving the gun; 2596.

#### *Further examination.*

Details again the principal points of former evidence; 2966. States that in the construction of the Armstrong guns in 1862-3, that  $24\frac{1}{2}$  per cent. of the 110-prs. have been condemned either before or after proof,  $28\frac{1}{2}$  per cent. of the 40-prs., 29 per cent. of the 9-prs.,  $10\frac{1}{2}$  per cent. of 6-prs., and, taking an average of the whole, it would be  $26\frac{1}{2}$  per cent. These losses are included in the cost of the guns; 2967. Considers that a modification of the breech-loading system of Cavalli-Krupp and the Armstrong wedge would make a good method of breech loading; 2971. Describes the difficulties of repair to the wedge system, and thinks it would not be far wrong to try a gun with a steel lining and a Krupp's wedge with a sunk cup; 2977-2990. Has not seen any plan of breech loading that will give entire satisfaction; 2999. Does not think the Whitworth breech loading for large guns will give satisfaction to anybody for a length of time, considers a muzzle-loading gun the best for all purposes; 3001. Prefers the hard surface to the projectiles and believes that the lead coating will deteriorate sooner or later; 3002. The effect of the bursting of shells in a gun where there is hard metal in both gun and projectile is as the relative hardness of the metal composing each. Believes that Mr. Whitworth's gun, if of wrought iron, would be injured considerably in this way. Thinks that this requisite hardness will be arrived at in steel tempered in oil, which requires a precise temperature to be adhered to; 3015. Describes the oil tempering process; 3018-3044. In speaking of the coil system restricts objection entirely to the inner barrel, which has been the cause of all the failures; 3048. Considers that a structure of one entire metal such as steel would be better for a gun than being built up. But would not use steel until more is known about it; 3052. Thinks that if the 110-pr. Armstrong were used a long time it would give way; 3058. The question of breech loading resolves itself into the probable advantage it may be to the service, and not to be decided as a mechanical subject; 3066. Up to the 40-pr. the objections to breech loaders are not so important as in heavier artillery; 3070. Describes the method of shrinking on the solid breech piece, and the tension due to shrinkage of coils; 3073-3082. According to theory, it is wrong to put a soft material outside a hard one, although as far as our practical experience goes it is safer; 3085. Theory points to a steel gun covered with steel hoops. Could not, however, recommend it now; 3087. The Whitworth principle of forcing on hoops cold has in it an immense deal to be considered; 3090. Homogeneous iron described; 3092-3096. Krupp's steel too soft for the inside of a gun. The Bockum steel is harder; 3098. Describes instances of failures in outer coils;

3109-3115. Besides 12-prs. there were some Elswick 40-prs., 20-prs., and 12-prs. lined; 3122. Having been shown the muzzle of an Armstrong gun that blew off, considered the accident due to a jam of the shot in the bore, and a fault in the welding of the coil; 3135. From observing a Whitworth shot which had been fired from a brass gun, infers it fitted badly, and that a brass gun would not last if fired with such shot; 3142. Recoil might be checked by mechanical means, and it is possible that if wrought-iron carriages were used lighter guns could be adopted; 3153-3158. Thinks that for driving a shot concentrically out of the bore, that, mechanically speaking, two driving surfaces would be most accurate. But it would give the gun too much to do at those parts; 3171-3175. Prefers Mr. Whitworth's to the shunt form of rifling; 3179. Considers Mr. Whitworth gives his gun a great deal of work; 3181. No rifling more easily done than the multigrooved system. The Whitworth would be easier done than the shunt rifling; 3203. Does not see any means of getting a good gun to answer equally well for a smooth bore as for a rifle; 3216.

#### ARMAMENT:

Witnesses consider that ships of war will have to carry guns of much greater weight than heretofore to enable them to contend against armour-plated vessels; *Armstrong* 164; *Hay* 1841. Evidence of the necessity for adding shell guns to the armament of field artillery; *Alderson* 605, 713; *Milman* 842-844; *Milward* 1322-1329; *Desborough* 1447-1450, 1466; *Boyer* 1586, 1587; *Hewlett* 2121; *Gardner* 2616-2618. Opinion favourable to the use of Armstrong guns for the armament of ships' broadsides; *Hay* 1840. Witness prefers the 68-pr. smooth bore for the broadside armament to the 110-pr. Armstrong; *Rice* 1942. Evidence mentions that if allowed to choose he would not have an Armstrong gun amongst the armament of his ship, but would prefer the 68-pr.; *Seymour* 2025. Witness considers that the principal armament of our ships of war should still be smooth bores, rifle guns being also supplied for special purposes; *Hewlett* 2149-2151. Statement that in arming a ship the witness would select the minority of Armstrong and the majority of muzzle-loading guns; *Powell* 2281, 2282. Witness states that the armament of coast batteries should depend very much on the depth of water. If deep enough for armour-plated ships to come alongside, would prefer the 68-pr. smooth bore; *Gardner* 2703-2705. Recommendation that smooth-bore ordnance should form a portion of the field artillery armament in the proportion of about half smooth bores; *ib.* 2729, 2730.

#### ARMSTRONG SIR WILLIAM, C.B. (*Analysis of evidence.*)

Proposes the 6, 9, 12, 20, 40-pr. for field service, also a muzzle-loading field gun on the shunt plan; 116-122. The whole of those guns to be on the coil system, and the mode of breech loading, the hollow breech screw, with vent-piece. Has always preferred a steel barrel for all guns, but has had much disappointment from the uncertainty in the quality of steel, but expects the time not far distant when that metal can be safely used; 123. Two or three modes of forming the steel block. Considers vent-pieces may be made of steel to stand anything. The strain on the breech piece being longitudinal its formation is different to the coils, being forged with the fibre placed longitudinally; 125. Always was of opinion that large breech-loading guns should load from the side. At first the gas escape was serious, but a continuance of experiments eventually produced a construction by which the former objections were obviated; 126. Prefers the screw breech-loading arrangements for the 40-pr. and all smaller guns, and the side movement for the larger natures. Describes the side-loading principle; 128. Proposes steel for the inner barrels as a means of escape from the imperfect welds that iron is liable to; 129. The first guns made were subject to imperfect welds, and some gave way crosswise; 134. Believes that if a properly manufactured gun on this principle is taken that it will be impossible to burst it; 136. Considers the steel lining would obviate the damage of shells bursting in the bore. The bursting in the 9-pr. shells caused by old pattern time fuzes being used in connexion with new pattern concussion; 139. Describes powder and shot chamber and rifling, and the projectiles; 140. Does not object to air space behind projectile, but thinks that the cartridges should be

long enough to fill the longitudinal space; 144. Service charge one-eighth the shot's weight. Was led to adopt breech loading from the particular nature of the projectile chosen, which, covered with a soft material, was intended to fill the grooves on being driven forward, and it therefore became necessary to introduce it from the rear; 146. Details the advantages of breech loading, and has considered it a matter for the service to choose whether they should use breech or muzzle loading, as he is prepared to propose muzzle-loading guns for the field, or large guns on the shunt plan if required. The projectiles would be internally the same as before, but instead of lead coating would have six brass studs; 147. Considers there is no danger now with vent-pieces in field guns; 159. The old pattern fuzes were liable to be injured by moisture. The present pattern are not so; 161. In a breech-loading gun the time fuze must be ignited by a detonating principle. Observes there is much difference of opinion as to the calibre of a rifle gun. Large calibre give the most destructive shell, while small calibre attains the greatest penetration. Thinks that any one form of rifling has no advantage over another, provided sufficient rotation and steadiness is given to projectiles. The Armstrong gun, as first introduced, was not intended to contend against iron-plated ships, and considers that much larger guns will be required for this service, and proposes 300-pr. of 12 tons, with projectiles suitable to the service it is required to perform; 164. Larger bores give higher initial velocity, which is not maintained so long as the smaller bores; 168. Velocity not checked but rather increased by lead coating on the projectiles; 173. Considers it desirable to use large grain powder in the large guns. The smaller guns are little affected by the kind of powder used; 176. Designed the 70-pr. shunt shell, so as to prevent injury to the bore of the gun by the friction of the rough portion of shell, but considers that by the perfection of casting now arrived at this becomes unnecessary to provide for; 180. Has no very definite rule as to the length of shot. Considers 2½ calibres good length for a shell; 188. The rapidity of twist in field guns should be about one turn in 38 calibres. It is a complex question to determine the proper twist. Have given the 300-pr. one turn in 65 calibres; 190. The twist should be uniform throughout. There are two causes of unsteadiness to projectiles—eccentricity of their centre of gravity and the resistance by the air to them, to counteract which respectively it is necessary to have the centre of gravity of shot far back for the first, and for the other far forward; 191. Can produce a shell for the 12-pr. if required. There is a common shell for the 20-pr. containing 1 lb. of powder, and the gun of that calibre would recommend as a howitzer of about 13 cwt. Proposes a 7-inch howitzer for siege and garrison use; 193. Concurs in the proposal to have batteries of shell guns in the service; 195. The process of toughening in oil has increased the strength of the vent-pieces enormously; 207. The cases in which the inner tubes have moved inside have been owing to the fact that at first the inner tubes were made too thin; 208-210. The blowing out of the vent-pieces obviated by the present change of pattern; 211. The thread of the present pattern breech screw an improvement on the former one; 215. The early vent-pieces were made of steel. They being thought uncertain, iron was found safer. Has now ascertained that a kind of Swedish iron is the best, but a perfect vent-piece would be one of mild steel tempered in oil; 217. Does not consider the temperature of the gun from firing would affect the coils injuriously; 220.

#### ARMSTRONG GUNS:

1st. In approval of the adoption of the Armstrong system.

2nd. Exceptions taken against these guns.

1st. In approval of the adoption of the Armstrong system.

*Cox*, S. 229-234. 285, 286. 294, 352; *Cox*, J. 415. *Alderson* 580; *Milman* 727; *Liddell* 944. 947; *Bechevaise* 1200, 1201. 1205; *Milward* 1327; *Taylor* 1486-1489; *Hewlett* 2049. 2092. 2130, 2131. 2212. Breech-loading not too complicated for general service, *Milman* 916; *Bechevaise* 1272; *Desborough* 1462. Breech loading safe and efficient up to the 40-pr. Armstrong gun, *Armstrong* 127; *Liddell* 1004; *Hay* 1834; *Gardner* 2634. Breech loading preferred to muzzle loading,

*Armstrong* 147; *Cox*, S. 286; *Cox*, J. 442, 447, 448, 478; *Liddell* 1041-1072; *Taylor* 1486; *Hay* 1834, 1844; *Hewlett* 2051, 2092. Breech-loaders preferred for special services, such as for casemates, sieges, and on board ship; *Alderson* 645, 690; *Gardner* 2605; *Hewlett* 2051. Remarkable accuracy and range from the Armstrong gun; *Cox*, S. 230, 231; *Cox*, J. 415; *Alderson* 580; *Milman* 737, 763; *Liddell* 944; *Bechervaise* 1196, 1200, 1201; *Milward* 1331; *Bozer* 1621; *Rice* 1904; *Hewlett* 2049; *Powell* 2269; *Gardner* 2603. Armstrong gun capable of bearing the rough usage of the service; *Liddell* 1064; *Milward* 1365; *Harrison*, R. 1896, 1897. Witness entirely disagrees with the evidence (of *Capt. Glyn* 1947, *Capt. Seymour* 2018) relative to the Armstrong gun being unsuited to boat service; *Hewlett* 2118. Opinions that the Armstrong guns are suited to boat service; *Liddell* 970; *Bechervaise* 1246; *Hay* 1844; *Hewlett* 2110-2112.

2nd. Exceptions taken against these guns.

Opinion that the 12-pr. Armstrong was useless for boat service; *Glyn* 1947. The practice with Armstrong guns in New Zealand not satisfactory; *Seymour* 1993, 1996, 2018. Would not have an Armstrong gun on board ship if permitted the choice; *ib.* 2027. Opinion that the Armstrong gun would not be likely to stand the rough usage of the service; *Glyn* 1947; *Seymour* 2000; *Gardner* 2609, 2645, 2672, 2685. Witness mentions the difficulties in working the 12-pr. Armstrong, and the fouling that he found to take place in the bore of the gun; *Bozer* 1623-1639.

### B.

BARREL. See FORGING.

BASHLEY BRITTEN, ESQ.

Statement of evidence that the zincing process, now used in the Royal Laboratory, was the system that had been carried out by Bashley Britten, Esq., and which had answered well up to the present time; *Bozer* 1687.

BECHERVAISE, MR. EDWARD. (*Analysis of evidence.*)

Is gunner in the navy, employed in the "Excellent." Considers the Armstrong gun everything that could be wished for the service in range and for accuracy, except the shortened 20-pr. which is less accurate than the others; 1204. 40-pr. easily worked as a broadside gun, also the 110-pr. as easy to manage as the old 68-pr., but in firing there is some delay by the tin cups jamming, the vent-piece requiring the use of a lever to free it; 1209. Prefers the muzzle loader as simpler and less complicated than the breech loader; 1218. Saw three accidents with vent-pieces, two caused by breech screw not being home; 1224. In arming boats no difficulty with Armstrong gun; 1246. Very little objection to the sights having to be detached from Armstrong guns; 1254. Ratchet sights would give equally good ranges with the Armstrong gun as the 24-pr. and 12-pr. old smooth-bore howitzer; 1264. No difficulty in surfacing the copper ring of powder chambers, but with the vent-piece there is much possibility of injury to it in refacing; 1269. The comparative elaborateness of the breech-loading arrangement in Armstrong guns is of no objection; 1272. All the vent-pieces are strong enough except the 110-pr.; 1274. Thinks there is no injury to be apprehended to the new pattern breech screws; 1276. Has not seen an Armstrong projectile sufficiently injured from rough usage to prevent loading with it; 1287. Great objection towards using the adapter with different screw to the fuze, either of which loosen; 1292. Considers it inconvenient to have to carry so many appliances, spare, for the Armstrong breech-loading guns, and so much gear and tools; 1306.

BENT, HUGH, CAPTAIN, R.A. (*Analysis of evidence.*)

Is assistant superintendent of laboratory at Devonport; 2754. Has noticed the condition of the bursters as much deteriorated; 2757; also the lead appearing loose on shot and shell, which had been through the tin process, also some from the undercut; 2758. The defect of the zinc process we have only begun to observe, unable to inspect percussion fuzes. Difficult to draw the pillar fuzes when they have been in shell long, and is a dangerous proceeding, recommends them not to be fixed, and that the gas pipe casing of fuzes should be lacquered. Rust forming, the cause of the coating on shell coming off. Desirable to inspect fuzes made by contract in case of any omission in manufacture 2754-2778. Lead coating of shells

becomes damaged from any moving and requires repair to pass gauges, with zinc process a small percentage of blisters occur.

BEST, LIEUT., R.A. (*Analysis of evidence.*)

I have had practice with both Armstrong and Whitworth guns at ranges from 500 to 2,000 yards. Fired 30 rounds from 12-pr. brass Whitworth, one shot was picked up broken, the edges found coated with brass from the gun; 2877. The Whitworth shrapnel and their fuzes did not act well; 2884. It was not caused by any irregularity in preparing the fuzes; 2890. The Armstrong practice was better than that from the Whitworth guns under trial; 2895. The practice from the Whitworth very bad both in range and lateral deviation; 2902. Saw the muzzle blown off an Armstrong gun; sure it was not full of sand when fired, as it had been sponged, the No. 1 reported; 2913. The elevation of the Whitworth guns was frequently altered, and gave uncertain results at the same elevation; 2930. Some dirt got into the muzzle of the Whitworth gun which did not cause any inconvenience; 2935. Some of the shot from the Whitworth gun very irregular in flight; 2939. The guns were well laid; 2945. Likes the Whitworth best for service; 2951. Prefers the muzzle-loading principle; 2953. The shot came out of the Whitworth gun by lifting up the trail of the gun carriage; 2965.

BOAT GUN:

The Armstrong gun, suitable for boat service; *Liddell* 970; *Bechervaise* 1246; *Hay* 1844; *Hewlett* 2110, 2112. Opinion that the Armstrong guns were not fit for boat guns; *Glyn* 1947; *Seymour* 2018. Objections to the use of Armstrong guns in boats; *Powell* 2259-2261.

BOXER, EDWARD MOURRIER, LIEUT.-COLONEL, R.A. (*Analysis of evidence.*)

Has carried on experiments with the Armstrong 12-pr. for the proof of ammunition; 1569. Has made a few experiments with the Whitworth 12-pr. to determine the form for its shrapnel shell, and found the taper to the rear of shell necessary to give increased range; 1570. Nothing more satisfactory than the construction of the Whitworth shrapnel shell; 1576. No difficulty in lighting the common service fuze with them, even when lubricators are used, the windage being sufficient; 1578. Does not consider the Whitworth gun would be sufficient for firing case shot and shrapnel. Advocates a battery of shell guns; 1585. Recommends the same for Armstrong guns; 1587. The Whitworth shot would be shorter than the shell; 1590. Proposes two bursting charges for the shrapnel shell to be used according to range; 1591. Bursting charge very small; 1596. 40 bullets and 10 segments in the 12-pr. Whitworth shell; 1599. If necessary could burst this shell within 20 yards from the muzzle; 1602. Whitworth shell better than the Armstrong; 1603. In shell of the shrapnel nature, objects to the bursting charge being in the centre of the shell, prefers the force from the bursting charge, giving as little distribution as possible; 1608. Whitworth shells give very great longitudinal spread; 1612. The flat-headed Whitworth projectiles appeared very accurate; 1617. The Whitworth and Armstrong guns more accurate than necessary for all practical purposes; 1621. Objects to breech-loading as it exists; 1622. Observed fouling in the chamber of an Armstrong gun after a few rounds; 1633. Whitworth projectile not likely to jam if sufficient windage be given to it; 1644. Has fired 400 rounds with Whitworth guns, and has not known a shot to stick in the bore; 1645. No difficulty in ensuring a supply of accurate shot for Whitworth guns; 1649. Less chance of unconsumed cartridge being left in rifle guns than in smooth bores; 1655. Believes a gun on the Whitworth system would give as much endurance as an Armstrong gun; 1657. If made of the same iron, the cost of the Whitworth projectile is less than the Armstrong; 1666. Estimates the cost of the Whitworth projectiles to be less than the Armstrong; 1667. Has found the fuze holes of the old pattern Armstrong shell much out of the centre; 1677. Has not observed loosening of the lead coating with the zinc process, but would not say that even that would stand all climates; 1684. Nothing to fear from the strain of the Whitworth rifle twist if the gun be of wrought iron, steel, or brass; 1688. Unless the rotation were rapid the Whitworth

shot would turn over in flight; 1689. Can see no objection to shot of different lengths being fired from the same gun; if sufficient rotation can be given to the long one, length will not affect the efficiency of a shell; 1691. Has seen some shells burst in a Whitworth gun, and not injure the bore; 1694. No reason why the common fuze should not be used with the Armstrong shell if a detonator be added; 1704. Does not think the Armstrong concussion fuze of much use as a means of bursting the shell on striking. Considers time fuze too complicated, and not fit for actual service; 1705. The india-rubber disc an objection to the Armstrong time fuze, and independent of that, has doubts about the keeping qualities of present pattern fuze; 1710. Considers the pillar fuze answers the purpose it was intended for, but is too delicate and dangerous for the service; 1725. The detonating composition of the Moorsom fuze has not been found liable to deteriorate in hot climates; 1729. Believes that penetration would be greater with a flat than with a round-headed shot if the target were inclined, but if vertical they would act about the same; 1735. The expense of reloading the unserviceable Armstrong projectiles is about 10% per hundred; 1740.

#### BREECH LOADING:

- 1st. Breech loading as a system.
- 2nd. The Armstrong breech loader on the screw and vent-piece principle.
- 3rd. The Armstrong wedge gun.
- 4th. The Whitworth and other breech loaders.

##### 1st. Breech loading as a system.

General approval of breech loading; *Armstrong* 147; *Cox*, J. 442. 468. 478; *Liddell* 1041. 1072; *Taylor* 1486; *Hay* 1834. 1844; *Hewlett* 2051. 2092. 2154. Opinions opposed to breech loading; *Whitworth* 53; *Alderson* 584; *Milman* 879, 880; *Bechervaise* 1217; *Milward* 1374. 1379; *Desborough* 1463; *Bower* 1622. 1641; *Seymour* 2015; *Powell* 2281; *Anderson* 2506. 2514. 2999; *Gardner* 2611. 2677. 2679. Want of confidence in breech loaders; *Hay* 1834; *Rice* 1910; *Seymour* 2014; *Powell* 2252. Breech loaders more liable to injury than muzzle loaders; *Cox*, J. 449. 467; *Milman* 917; *Powell* 2254. The question of breech loading resolves itself into the probable advantage it may be to the service, and should not be considered as a mechanical subject; *Armstrong* 147; *Anderson* 3066. A breech-loading gun best adapted for firing from cupolas; *Liddell* 974. The comparative elaborateness of breech-loading Armstrong gun is no objection to it for general service; *Bechervaise* 1272.

##### 2nd. The Armstrong breech loader on the screw and vent-piece principle.

General description of the manufacture of these guns; *Armstrong* 123-126; *Anderson* 2350. 2359. 2398. Confidence felt in the Armstrong breech loaders; *Hewlett* 2158.

##### 3rd. The Armstrong wedge gun.

A misnomer to call the wedge gun a side-loading gun; *Armstrong* 204. A description of the wedge gun; *Armstrong* 126-128. General approval of the wedge gun; *Cox*, S. 390. 398; *Cox*, J. 539; *Milman* 796; *Hewlett* 2078; *Gardner*, 2613. Opinion recommending the introduction of the wedge principle into all guns, provided it will stand heavy charges; *Hewlett* 2080. Recommended for heavy guns only; *Cox*, S. 396. The necessity of extra wedges being supplied to each gun; *Gordon* 1764-1768. Out of three wedge guns two required repair after the proof; *Gordon* 1772. The difficulties of repair increased by the introduction of the wedge gun; *Anderson* 2558-2573. 2977-2983. Opposed to the use of the wedge principle for field guns; *Alderson* 596. The wedge gun quicker to work than the screw breech loader; *Cox*, S. 398.

##### 4th. The Whitworth and other breech loaders.

Witness expresses his willingness to produce breech loaders for trial before the Committee, but does not recommend such a system; *Whitworth* 13. 51-53. Evidence mentions a trial at Shoeburyness between Armstrong and Whitworth 12-pr. breech-loading guns, but that Mr. Whitworth had given up breech loading; *Taylor* 1481-1484. Opinion that Mr. Whitworth's breech-loading arrangements were very defective; *Hewlett* 2051. Witness does not think the Whitworth breech loader will give satisfaction; *Anderson* 3001. Evidence of the excellence of range and accuracy of the Whitworth gun; *Cox*, J. 500. 521; *Alderson* 623. 706; *Milman*, 735; *Boxer* 1621; *Gardner* 2731. The breech-loading system of Mr. Westley Richards mentioned, as likely to remove all objections to breech-loading; *Hay* 1835. Captain Cavalli's breech-loading gun and its failure alleged as a precedent for an objection to the principle of hard metal in a projectile working against the metal of the gun; *Hewlett* 2093-2095. Statement made relative to different plans for breech loading, such as the Warendorf, Cavalli's, Church and Goddard, Armstrong and Krupp, and opinion given that a plan combining the good points of the systems of Cavalli, Armstrong, and Krupp would make as good a breech loader as can be made; *Anderson* 2971. Opinion that the introduction of a steel lining, a Krupp's wedge with the sunk cup should not be very far wrong, 2990.

#### BREECH SCREW ARMSTRONG:

- 1st. Hollow screw for breech loaders.
- 2nd. Solid screw for muzzle loaders.

##### 1st. The hollow screw.

Mentioned as a portion of the Armstrong breech-loading system; *Armstrong* 123. The liability of the old pattern thread of this screw to strip; *Armstrong* 215; *Cox*, S. 250. 263. 278; *Cox*, J. 437. 459; *Alderson* 589. 598. 603; *Liddell* 1147. 1155. 1157; *Bechervaise* 1277; *Hewlett* 2159; *Anderson* 2398; *Gardner* 2679. A change of form in the thread of the screw renders it less liable to break, and makes it stronger; *Armstrong* 215; *Liddell* 1147; *Bechervaise* 1278; *Anderson* 2398. Opinion that the breech screw is not strong enough in the 12-pr.; *Anderson* 2515. The breech screw sometimes damaged by the breaking of the vent-piece; *Cox*, J. 440; *Alderson* 650. Complaint that the breech screw got so stiff that it was difficult to work; *Boxer* 1624; *Gardner* 2634. In landing an Armstrong boat gun, would recommend the breech screw to be taken out; *Hewlett* 2114; *Powell* 2261.

##### 2nd. Solid screw for muzzle loaders.

The method of supporting the interior barrel of large muzzle-loading guns by means of a solid screw explained; *Anderson* 2488; *Noble* 3572-3578. Method of dispensing with solid screw, and using solid breech-piece; *Anderson* 3074.

#### BREECH PIECE:

The difficulty of forging large breech piece; *Anderson* 2433. The old method of forming breech piece; *ib.* 2387. The present method of making the breech piece solid; *ib.* 2400. Opinion given that the breech piece for large guns should be solid, and without the supporting screw; *ib.* 3074. The breech piece a means of conveying the strain from the breech to the trunnions; *Noble* 3582-3584. 3587-3592.

#### BREECHING ROPE:

Statement that it was considered necessary to give the 40-pr. a stronger breeching rope in consequence of the excessive recoil of that gun. But from experiments it had been shown that a 32-pr. gun breeching rope had been sufficient for a 40-pr. during 1,000 rounds; *Liddell* 1159-1166; *Hewlett* 2147.

#### BROADSIDE:

Witness details the disadvantages of the Armstrong gun for broadside use on board ship; *Liddell* 986. The 40-pr. Armstrong worked admirably as a broadside gun; *ib.* 1004. The advantages of the Armstrong gun for the broadside is the rapidity of fire over the smooth bore, except the 110-pr.; *ib.* 1028-1041. The 40-pr. is easily worked as the 32-pr. smooth bore on the broadside; *Bechervaise* 1207. Witness would prefer the Armstrong guns for the broadside. It would be necessary to have heavy guns for the broadside to contend against iron-plated ships. Would limit the weight of gun to about five tons; *Hay* 1840, 1841; *Rice* 1935. Witness prefers a smooth bore for a broadside gun from the rapidity of loading possible with it; *Seymour* 2031, 2032. Opinion that broadside guns should not be more than six tons weight; *Hewlett* 2083. Witness sees no objection to 10 tons for a broadside gun if every necessary appliance for working be supplied; *Powell* 2266.

## BRONZE OR BRASS:

Of the competitive guns offered by Mr. Whitworth to the Committee one 12-pr. muzzle-loading gun is made of brass; *Whitworth* 62. Witness considers that brass is comparatively inferior to wrought iron for guns, and mentions the circumstance of the bore of the brass muzzle-loading Whitworth gun becoming burred; *Cox*, *S.* 228. 303. Additional evidence as to shot sticking in the bore of the brass muzzle-loading Whitworth 12-pr.; *Cox*, *J.* 509, 510; *Alderson* 619, 620; *Taylor* 1498-1500. Witness mentions the muzzle-loading field guns of Mr. Whitworth as being of brass; *Milman* 740; *Taylor* 1485. Experiments of Colonel Boxer made with brass 12-pr. Whitworth gun; *Boxer* 1573. Experiments with Whitworth's brass howitzer for penetration through water; *Hewlett* 2168. The application of bronze as a gun metal; *Anderson* 2335-2339. Experiments with Whitworth's brass guns. Wearing of the grooves observed; *Isacke* 2835-2837; *Best* 2874. 2891; *App.* 165. Witness infers that a brass rifle Whitworth gun would not last long; *Anderson* 3142.

## BURSTING:

The bursting of shells in the bores of Armstrong guns no serious injury to them; *Alderson* 618. 701, 702; *Liddell* 1128; *Milward* 1387; *Taylor* 1504; *Hewlett* 2049. The effect of bursting shells with small bursting charges in the Whitworth gun not injurious; *Boxer* 1694. Opinions of the bad effect of bursting shell in Whitworth brass guns; *Alderson* 616; *Taylor* 1498. Security from bursting felt in using the wrought-iron coil gun; *Alderson* 721; *Liddell* 1148; *Anderson* 2412. Bursting of the 150-pr. smooth bore; *Taylor* 1555. Bursting or splitting of the Whitworth 80-pr.; *Gordon* 1760; *Hewlett* 2068. 2076. Bursting of two cast-iron rifled Lancaster guns at Kinburn adduced as a reason for objecting to muzzle-loading rifle guns for naval service; *Seymour* 2033. The bad effects of bursting shells in the bores of Armstrong guns would be obviated by the introduction of steel barrels into the guns; *Armstrong* 139; *Anderson* 2419. Bursting at the muzzle of an Armstrong 12-pr.; *Best* 2905. Evidence of the bursting of a Whitworth gun supplied to the Danes; *Whitworth* 3871. 3886-3891. 4039.

## BURSTING CHARGES:

Importance of large bursting charges in shells; *Armstrong* 164. Statement of the effect of bursting segment Armstrong shells in front of a column of troops; *Alderson* 627. Witness mentions the increase of bursting charge found necessary for Armstrong segment shell; *Alderson* 632. Bursting charges for various shells mentioned; *ib.* 715-718. Witness states that with the old bursting charge the shell for Armstrong field guns did not break up, but the new bursters act well; *Milman* 935. Witness prefers a shell for the field with larger bursting charge than the 12-pr. Armstrong shell; *Desborough* 1451. Evidence proposes two bursting charges for the Whitworth shrapnel shell to be used according to range; *Boxer* 1591. The change of bursters for Armstrong segment shell liable to cause inconvenience where the old and new patterns exist; *Gordon* 1810. Witness mentions the advantage of having the bursting charge in the centre of the Whitworth 12-pr. shrapnel shell; *Boxer* 1604. Deterioration of the iron bursters for Armstrong shell; *Bent* 2757.

BUSHING. See FACING.

## C.

## CALIBRE:

The calibre of the Whitworth system of ordnance detailed; *Whitworth* 1. 3. 4. 7. 10. 14. 27. 30. 41. 43; *App.* 161. Calibres of Armstrong guns; *App.* 159, 160. Witness states that large calibre has the advantage of enabling a shell to be used with a great capacity for powder, thus increasing its effect, while the small calibre has more penetrating power and gives more range; *Armstrong* 164. Calibre of the 300-pr. Armstrong gun; *ib.* 166. Mentions 2½ calibres as a good rule for length of shell; 188. The calibre of the Armstrong and Whitworth 12-pr. guns contrasted; *Alderson* 626. Opinion that the smallness of calibre of the Armstrong guns used in the naval service is more than compensated by the greater bursting charge in their shells; *Liddell*, 1159. Witness would not wish to have the calibre of

the 12-pr. Armstrong gun smaller. Would prefer it larger; *Milward* 1394. The calibre of the Whitworth 120-pr. (so called) and the Armstrong 110-pr. is the same, namely seven inches; *Taylor* 1514-1516.

## CANADA:

Witness mentions the injury to the lead coating of the Armstrong shells in Canada, and the advantage that would accrue to the use of 20-pr. Armstrongs in the field batteries in that country; *Gardner* 2627. 2668, 2669. 2697.

## CARRIAGES:

Witness mentions weight of the carriage for 1-pr. Whitworth gun, and does not propose any alteration in the 9 or 12-pr. Whitworth gun carriage; *Whitworth* 1, 2, 109. Witness mentions that the 20-pr. Armstrong gun had not been tried on a proper carriage, and states that recoil is of no consequence in field artillery when the carriages are uninjured thereby. The converted carriages for 12-pr. Armstrong guns break; *Alderson* 611, 612. 688. Witness mentions the weakness of Armstrong field gun carriage; *Milman* 887, 888. The carriages sent to China with Armstrong 12-pr. of 6 cwt. were of very faulty construction, and they failed; *Milward* 1332. Statement of the difficulty of moving an Armstrong gun from its boat to its field carriage, and complaint that the boat carriage is raised and takes up too much room; *Glyn* 1947. 1955. Opinion that a slide carriage with mechanical appliances would be necessary for a broadside gun of 6 tons weight; *Hewlett* 2083. Objection to the carriage of 110-pr. Armstrongs on board ship as not permitting of sufficient training of the gun; *Powell* 2229. Witness mentions the difficulty of constructing a carriage to withstand the shock of a light gun, and recommends wrought iron for gun carriages; *Anderson* 3154. 3158.

## CARTRIDGES:

Opinion that the use of flannel cartridge may be dispensed with by using Brown's solidified powder; *Whitworth* 54. Originally the communication to the cartridge of Whitworth gun was too small. Mention made of the extractor necessary for Whitworth cartridges; *Whitworth* 94, 95. Desirable that the cartridge should be the whole length of the powder chamber; *Armstrong* 144. Mention made of the difficulty in withdrawing the metal case of the cartridges of the Whitworth gun; *Taylor* 1481. Complaint of the cartridge of an Armstrong gun projecting three or four inches outside the chamber from the shot not being sent home from the fouling of the gun; *Boxer* 1632, 1633. Statement that it is preferable to ignite a gun cartridge in the centre, more especially of gun cotton; *Whitworth* 3922.

## CASEMATES:

Opinions as to the advantages of a breech-loading gun for the armament of casemates; *Armstrong* 147; *Cox*, *J.* 478; *Alderson* 645. 689, 690; *Hay* 1834; *Gardner* 2605.

## CASE SHOT AND GRAPE:

As a substitute for case shot recommends the Armstrong segment shells carried in the axletree boxes to have the fuzes fixed at zero; *Milman* 837. Witness has greater confidence in the Armstrong segment shell than in the old grape and case shot; *Liddell* 1138, 1139. Witness thinks that the segment shell is not equal in effect to grape and case from a howitzer; *Seymour* 2043.

CAST IRON. See IRON.

## CHAMBERS:

Statements that the powder chamber is the part of the Whitworth gun that wears; *Whitworth* 104. 4073. The formation of the powder and shot chamber in the Armstrong gun explained; *Armstrong* 140. No instances of deterioration in the Armstrong gun powder chambers; *ib.* 175. Some longitudinal scoring in the powder chamber of certain Armstrong guns the cause of abandoning the plan of making the inner tubes from solid forgings; *Anderson* 2460.

## CHARGE:

Rule given for charge for Whitworth guns as one-sixth the weight of its shot of three diameters in length; *Whitworth* 16. Statement of the service charge for Armstrong guns being one-eighth the

weight of the projectile; *Armstrong* 146. The proof charges of Armstrong 12-pr. consist of two rounds of 3 lbs. and five of 2 lbs.; *ib.* 136. Opinion that the proportion of charge to projectile which is used in the Whitworth gun could not justifiably be used in the Armstrong gun in consequence of the construction of the latter not being intended to bear it; *Taylor* 1512, 1513, 1522. For the general detail of charges for Armstrong and Whitworth guns; *App.* 159-161. For charges used in the penetration of brick, earthwork, and oak with Armstrong gun and Whitworth gun into oak; *App.* 158. The powder chamber of the 12-pr. Armstrong could contain 2 lbs. of powder; *Milman* 864. Opinions that for the penetration of iron plates the greatest effect will be produced by the gun standing the heaviest charge with a projectile of proper material; *Harrison, A.* 1414; *Hay* 1832. The heavier Whitworths at Shoeburyness have been fired with much larger charges than the corresponding Armstrong guns; *Taylor* 1511-1514. Statements that muzzle-loading guns give the best promise of success against iron plates from their being able to stand heavy charges; *Harrison, A.* 1435; *Hay* 1841; *Hewlett* 2092, 2187. Evidence considers that the Armstrong guns are not fired with charges proportionate to their bores; *Whitworth* 3836-3855.

#### CHINA:

The general result from the use of the Armstrong guns in China and detail of the services performed by those guns in the war of 1860; *Milward* 1307-1400; *Desborough* 1445-1479; *Harrison, R.* 1863-1899. (See Analysis of the evidence of these officers. Allusions made to the experience gained in the use) of the Armstrong guns in China, founded on the reports of Lieut.-Colonel Barry and Major Hay, Royal Artillery; *Gardner* 2619, 2645, 2656.

#### CLEANING:

The Whitworth gun capable of being cleaned and ready to fire as soon as a smooth bore; *Whitworth* 83, 88-93. Evidence that the breech screw of 12-pr. Armstrong could be cleaned in two or three minutes; *Cox, S.* 277. No necessity to clean the Armstrong gun in practice with it since the introduction of the lubricator; *Cox, J.* 565-576. Evidence of the rapidity with which an Armstrong gun can be cleaned and ready to fire; *Alderson* 696-699; *Milward* 1365, 1366; *Taylor* 1491; *Harrison, R.* 1896, 1897.

#### COAST DEFENCES:

Evidence that the armament for coast defences should be 68-prs. if the range is short, and the largest smooth bores would be invaluable under such circumstances; *Gardner* 2614, 2703-2705.

#### COATING TO PROJECTILES:

The coating of Armstrong projectiles liable to strip more or less on firing; *Cox, S.* 356-359; *Alderson* 582; *Milman* 936; *Taylor* 1566, 1567; *Gordon* 1788; *Glyn* 1972, 1973; *Seymour* 1993; *Hewlett* 2204. Since the method of attaching the lead coating to the Armstrong projectiles by means of the zinc process, the stripping has been obviated; *Cox, S.* 361; *Alderson* 582; *Taylor* 1566; *Boxer* 1684, 1687, 1739; *Gordon* 1791; *Hewlett* 2204, 2205. The method of attaching the lead coating by means of the tin process was defective, and caused stripping and separation of the metals; *Cox, S.* 408-410; *Boxer* 1680, 1682-1687; *Gordon* 1783-1788, 1792; *Glyn* 1990; *Hewlett* 2204. Opinion that the stripping of the Armstrong projectiles is of no practical disadvantage; *Milman* 936-939; *Milward* 1383-1385; *Taylor* 1566-1568. Evidence of the advantage of a coating of soft metal on rifle projectiles; *Armstrong* 147; *Alderson* 618; *Taylor* 1505; *Hay* 1836, 1838; *Hewlett* 2076. Cost of releading Armstrong projectiles by the zinc process about 10l. per 100; *Boxer* 1740. Witness mentions that he noticed that the gradual loosening of the lead on Armstrong projectiles, first on those of the tin process then on the undercut system, and those on the zinc plan seem to suffer from blisters, but has only now begun to observe defects in them; *Bent* 2758, 2759, 2771, 2794-2796. Some of the Armstrong projectiles so knocked about when returned from ships that they would not pass the gauge; *ib.* 2783-2786, 2793. Evidence in favour of attaching lead coating to shells by undercutting, considers it more economical than the zinc process; *Noble* 3623-3647.

#### COIL SYSTEM

Witness mentions that the Armstrong guns are all made on the coil system, as well as other guns made for experimental and competitive purposes, Mr. Whitworth having availed himself of it; *Armstrong* 123; *Taylor* 1526-1528; *App.* 155. Statement that the Whitworth guns are made upon a different principle from the Armstrong coil system; *App.* 157. The construction on the coil system an element of confidence in the use of the Armstrong guns; *Alderson* 721; *Liddell* 1148; *Taylor* 1531; *Hewlett* 2157; *Anderson* 2377, 2412; *Gardner* 2718, 2719. The construction of guns on the coil system fully given; *Anderson* 2350-2598, 2966-3224. (See Analysis of his evidence.) Superiority of the coiled or built-up gun to one made of a solid forging; *ib.* 2432, 2433. Want of strength in the coils in a longitudinal direction; *ib.* 2350-2362. The circumferential strength of coils about 26 tons per square inch; *ib.* 2362. Coiled barrels or inner tubes were not satisfactory from the difficulty of making them with perfect welds, and from their weakness longitudinally; *ib.* 2359. In the manufacture of coiled guns there is great facility for inspection during the various operations; *ib.* 2443, 2444. On the judicious arrangement of the coil depends whether the gun is good or bad; *ib.* 2499. Statement of the tensional strain on the coils of Armstrong guns; *ib.* 3077-3082. Witness considers steel hooped a-coil gun; does not trust to the steel barrel for strength of the gun, but to the coils placed over; *Noble* 3299-3302, 3316-3322. Wrought-iron barrels have been abandoned at Woolwich for coiled barrels, the former being a failure; *ib.* 3350-3353, 3472. The coil gun made up of a number of sections not united except in the second tube; *ib.* 3354-3357.

COLES, CAPTAIN COWPER. See CUPOLA.

#### CONFIDENCE:

Evidence showing the confidence felt in the use of the Armstrong gun; *Alderson* 721; *Liddell* 1149; *Taylor* 1531; *Hewlett* 2130, 2158. Evidence of the want of confidence in the Armstrong gun felt in the Royal Navy; *Hay* 1834, 1835; *Rice* 1910; *Seymour* 2014; *Powell* 2252. The Armstrong gun not well known in the fleet, and therefore there is want of confidence in it; *Hewlett* 2131.

#### CONDEMNED GUNS:

Evidence of the per-centage of guns condemned in the Royal Gun Factories during the year 1862-1863; *Anderson* 2967.

#### CONSTRUCTION:

Statement as to the construction of the Armstrong screw and wedge breech loaders; *Armstrong* 122-128. (See Mr. Anderson's evidence.) Opinion given that an error in the construction of the 150-pr. probably caused its destruction by bursting; *Taylor* 1557, 1558.

COX, JAMES, Serjeant, R.A. (*Analysis of evidence.*)

Is staff serjeant of experimental department at Shoeburyness. The Armstrong gun the best he ever handled. No fear of its bursting. Is light, gives good range with great accuracy; easier to work than old 9-pr.; 415. Has trained men in half an hour to work the Armstrong gun who had never seen one before; 421. Could perfect the training of men in this drill in a fortnight; 424. With an untrained party fired five rounds from 110-pr. in six minutes some seconds; 426. Breaking of vent-pieces generally caused by using a charge larger than the usual one; 434. Breaking thread of breech screw not caused by discharge of the gun; has only occurred to small guns; 437, 438. Prefers breech loaders from greater facility of loading and safety; 442. There are guns which have fired 200 rounds without refacing vent-piece; 453. Has felt inconvenience from heat in old pattern vent-piece, not in the new with a handle; 454. By carelessness the vent-piece may be blown out; 465. From the complication of a breech loader it is more liable to injury than a muzzle loader from an enemy's fire, notwithstanding which, would prefer to have the former in the field; 467. For heavy guns would prefer the muzzle loader if equal in effect of fire to the breech loader; 471. Would rather have a breech loader in a casemate; 478. Considers the muzzle loader the quickest in working; 480. Requires to alter the position of gun when firing at high elevations; 482. No difficulty with the cups of the 110-pr.; 488. Has seen fired the Whit-

worth 12-pr. and 70-pr., the first of brass, the other of iron; 491. Great difficulty in getting the shot home in 70-pr.; 496. Cannot load with it as quick as a smooth bore, or a muzzle-loading rifle gun; 496. Got good practice with it, but thinks the 70-pr. Armstrong the best; 497. Range of Whitworth greater; 500. The difficulty of loading Whitworth is caused by the want of windage; 504. In loading the 12-pr. Whitworth of brass a shell jammed; 506. This gun gave good range; 521. Against iron plates the Whitworth has penetrated the most; 529. Has greater velocity and penetrating power; 535. Prefers the side-loading system to vent-piece; 539. With 70-pr. side loader 50 rounds were fired with good range in 32 minutes and 32 seconds; 540. Loss of time by depression of gun; 547. Has not seen projectiles permanently injured; 552. Whitworth shell not good; 559. Shunt 70-pr. equal for practice to the breech-loading 70-pr.; 569.

COX, SAMUEL, Master Gunner. (*Analysis of evidence.*)

Is master gunner at Shoeburyness, and previously serjeant instructor there; 225. Assisted at experiments at the time of the introduction of the Armstrong gun; 228. Considered that system a great improvement on the old; never before saw such ranges or precision. Does not remember accidents or injury to those working the guns; 233. No difficulty in instructing men in the drill. The fuzes and shells superior to those used before; 236. A good artilleryman should put the whole of his fire upon a column of companies at 3,000 yards; 237. Easy to instruct men in the use of fuzes; 238. Can in three weeks drill recruits to work a 12-pr. properly; 239. Considers No. 2 the only man of the gun detachment who could cause accident, by neglect of duty, from the vent-piece not being screwed up; 241. But with new vent-piece there would be no danger to the men; 247. But still to the breech screw; 250. Has seen old pattern vent-pieces blown out and broken; 251. Prefers having one kind of projectile to answer as shot, shell and case; 257. The thread of the breech screw at the end for two or three inches generally breaks off; 264. Has seldom noticed any choking of the vent; 273. If there was no oil to clean the breech screw, it could be taken out and cleaned in two or three minutes; 276. Tangent rings get loose after firing; 281. Has seldom known the keep pins of the tappet ring fall out; 282. Has no objection to, or alteration to suggest in, the Armstrong gun, and likes the breech-loading as well as the muzzle-loading system; 286. Considers there is a trifling difference in the rapidity of firing in favour of the muzzle-loading against the breech-loading rifle gun; 292. Prefers the Armstrong to the Whitworth gun, as its projectile is more destructive; 295. Considers the Armstrong gun, as made of wrought iron, is better than the Whitworth of brass, and from the quickness of twist in the Whitworth it is liable to damage, and the shot sticking in the bore, of which a case happened; 299-307. Has seen projectiles slightly damaged, but are easily rectified. Has not seen any projectile damaged by travelling; 308-323. The 12-pr. is easily dismantled; 326. Has seen 3,173 rounds fired from one gun now serviceable at Shoeburyness; no part was changed except the vent-piece; 329-333. Has known the vent-piece too hot for the men to handle in about 80 or 100 rounds; 336. Thinks the loosening of the copper ring on vent-piece the forerunner of the vent-piece breaking; 339. Considers the segment shell destructive at 3,000 yards with concussion fuze; 345. Has had no difficulty in working the heavier natures of Armstrong guns, and found them equal in accuracy to the smaller; 352. Has known lead strip off Armstrong 12-pr. shell so that it would be objectionable to fire over our own men; 359. The stripping does not interfere with the flight of the shot; 363. Sometimes there is a slight difficulty in lifting the vent-piece of a 110-pr., which may occur from the tin cup; 368. The heavier projectiles more liable to injury than the lighter ones; 372. The recoil of the shortened naval 20-pr. is very great; 380. 110-pr. Armstrong gun not fired quite so fast as 68-pr. smooth bore; 383. The wedge gun superior to the other, as dispensing with the screw; 390. Considers it beneficial to adapt the system to heavy guns only; 396. Wedge principle permits of quickest loading; 398. Considers vent-pieces for heavy guns weaker than those for light guns; 400. Believes that the projectiles coated by the tin process will become loosened; 410.

#### CRUTCH:

Witness remarks the want of a means of preventing the priming of the Armstrong gun before the vent-piece is in its place, and mentions a crutch designed for that object by Captain Singer, R.N.; *Liddell* 993.

#### CUPOLA:

Statement of experience in the management of the cupola, and result of using the 40 and 110-pr. Armstrong guns in them, and opinion that the breech-loading gun is best suited for their armament; *Liddell* 951. 973-976. 1053. 1090-1092; *Powell* 2317-2322. The possibility of carrying very large guns on board ship is effected by Captain Coles' cupola; *Hay* 1853, 1854; *Hewlett* 2086, 2087. From the confinement of space inside a cupola there would be a difficulty in loading a muzzle loader; *Powell* 2246-2249.

CUPS. See GAS.

#### D.

DEFECTS. See FLAWS.

#### DEFLECTION:

Evidence of the accurate correction for deflection which may be made with the Armstrong gun; *Milman* 730, 731. Statement extracted from Major Hay's report, that the men paid little attention to accuracy in adjusting for deflection in the expedition to China; *Gardner* 2656. The deflection with Armstrong projectile greater than with the Whitworth shrapnel with taper; *Boxer* 1570, 1571.

DESBOROUGH, JOHN, Lieut.-Colonel, R.A. (*Analysis of evidence.*)

Commanded a division of artillery in China. Considers the effect of the common shell from 24-pr. howitzers was superior to the fire from 12-pr. Armstrong, as proved by the silencing the fire of two Chinese junks at 500 yards; 1447. Would arm field batteries with some shell guns on the Armstrong principle; 1450. Is of opinion that the Armstrong gun was not sufficiently tried in China to form an opinion upon its merits; 1456. Does not think the machinery of the breech loading caused the men to be flurried under a hot fire from the Taku forts; 1462. Would prefer muzzle loaders; 1463. From what has been said of the shortened 20-pr. Armstrong, would prefer it to the 24-pr. howitzer smooth bore as a shell gun; 1466. Mentions the report of men of the 44th Regiment having been injured by Armstrong shell fragments; 1471. The guns were not roughly used; 1476. The wagons were heavy; they were experimental; 1477.

DESTRUCTIVE EFFECTS. See FIRE, SHELL.

#### DISMOUNTING:

Method used in dismantling 12-pr. Armstrong gun; *Cox*, S. 324-326. Evidence of the necessity of having a lip under the muzzle of guns on board ship for safety in dismantling; *Liddell* 1067.

#### DRILL AND EASE OF WORKING:

Evidence generally as to the ease of drilling with and working the Armstrong gun; *Cox*, S. 232. 234. 238. 239. 352. 364; *Cox*, J. 419-426; *Milman* 780-782; *Liddell* 1036; *Milward* 1344; *Hewlett* 2132. 2183; *Powell* 2285; *Gardner* 2604. Complaints as to the difficulty of working 110-pr. Armstrong gun; *Milman* 787, 788; *Gardner* 2638. 2665. Statements that it is easier to work the 68-pr. smooth bore than the 110-pr. Armstrong; *Cox*, S. 383; *Alderson* 648; *Milman* 804; *Rice* 1911. 1919. Witness states that the wedge system works easier than 110-pr. Armstrong. That the breech-loading heavy guns are more laborious than the muzzle-loading heavy guns. There is greater ease in working the shunt 120-pr. than the breech-loading 110-pr. Armstrong; *Milman* 796. 801. 814. Witness observes that the 110-pr. is as easily worked as the 68-pr. with the exception of loading and firing; *Bechervaise* 1209. Statement of the difficulty found by the witness in working an Armstrong 12-pr. breech-loading gun; *Boxer* 1623, 1624. Witnesses state that the heavy smooth bore is quicker in serving than the heavy breech loader; *Cox*, J. 526; *Powell* 2243. Evidence that it takes longer to train men to the breech-loading than to the muzzle-loading system; *Gardner* 2728. Statement made of no difficulty being found in working the vent-piece of the

110-pr. Armstrong, as it only required men of a certain height; *Powell* 2289; *Hewlett* 2082. Witness mentions the difficulty in loading the 70-pr. Whitworth gun; *Cox*, *J.* 495, 496. The Whitworth brass 12-pr. equalled in facility of working the Armstrong gun; *Alderson* 624. Difficulty in loading the Whitworth gun; *Hewlett* 2052, 2072. Evidence given as to a case in which a Whitworth gun became damaged in the bore and caused a difficulty in loading; *Cox*, *S.* 301, 306; *Cox*, *J.* 506; *Alderson* 619; *Taylor* 1498-1500. Evidence that four 12-pr. brass Whitworth guns were worked very easily at Hythe; *Isacke* 2804. Statement of witness that there is not any material difference in the ease of working the Armstrong and Whitworth 12-pr. guns, but of the two the Whitworth is the quickest and has least work for the detachment; *Best* 2949. Evidence that the first Whitworth guns made had too little windage, and caused the shot to stick; *Whitworth* 84. Opinion that if sufficient windage is given that the Whitworth projectile will not stick in the bore; *Boyer* 1614.

## E.

EFFECT OF FIRE. See FIRE.

## 80-PR. WHITWORTH GUN:

Evidence of the 80-pr. Whitworth gun becoming unserviceable from splitting or bursting; *Gordon* 1760; *Hewlett* 2068, 2069.

## ENDURANCE:

Evidence considers the wrought-iron Armstrong gun more durable than the Whitworth brass gun, and states that the greatest number of rounds that he has known fired from an Armstrong 12-pr. was 3,173; *Cox*, *S.* 299, 329. Witness states that one 12-pr. Armstrong gun fired 3,000 rounds, and was still serviceable; *Milman* 861. Evidence observes that 2,400 rounds were fired from a 12-pr. Armstrong from the "Excellent," and believes that the breech-loading Armstrong guns are capable of enduring the roughest service; *Liddell* 954, 1062, 1064. Witness states that the guns under his command endured much rough work in China without injury; *Milward* 1365. Instance given of the endurance shown by some Armstrong guns in not being injured by being precipitated into a ditch; *Alderson* 696-698; *Taylor* 1491. Evidence of Armstrong guns having endured 3,000 rounds without injury, and a statement of belief that there is one gun which is still sound and has fired about 3,600 rounds; *Taylor* 1552, 1553. Opinion as to the importance of enduring powers in a rifle gun; *Hay* 1832, 1834, 1835. Witness states you may treat the Armstrong guns as roughly as any guns in the service, and thinks that one 40-pr. Armstrong endured 1,000 rounds and was perfectly serviceable; *Hewlett* 2113, 2147, 2148. Opinions that the Armstrong guns were unfitted to stand the rough usage of the service; *Glyn* 1947; *Seymour* 2000; *Gardner* 2609, 2645, 2672, 2685. Witness is of opinion that a gun rifled on the Whitworth principle is capable of as much endurance as an Armstrong gun; *Boyer* 1657. Opinion that although the Whitworth gun has a great deal of work to do, from the rapidity of its twist and length of projectile, yet it is equal to the strain; *Anderson* 3181-3183.

## EXPENSE:

Expense of shaping the 12-pr. Whitworth shot, 5*d.* per dozen; *Whitworth* 54, 4026. Statement of expense of 12-pr. Armstrong segment shell with burster and concussion fuze to be 6*s.*; *Armstrong* 153-155. Witness states that the cost of the Whitworth projectiles is less than those for the Armstrong gun if the same iron be used, and gives the prices of Armstrong and Whitworth 40-pr. projectiles; *Boyer* 1666, 1667. Cost of reloading Armstrong projectiles become unserviceable from being coated by the tin process, 10*l.* per 100; *ib.* 1740. Evidence of the expensive nature of the 'proof' requisite for vent-pieces; *Gordon* 1776. Statement that the expense estimated for 364 12-pr. Armstrongs was 200*l.* a piece, and that they were done for 83*l.*; *Anderson* 2374. Opinion that coil guns are not very expensive, but that solid forged guns would be cheaper; *Anderson* 2431, 2432. Evidence that the addition of steel barrels to Armstrong guns would not add much to the expense; *Armstrong* 133. Statement that the cost mentioned of Armstrong guns includes the guns rejected at proof; *Anderson* 2967. Cost of the metal

for the manufacture of the Whitworth gun, 60*l.* to 90*l.* per ton, according to the size of the barrel required for the gun; *Whitworth* 3779-3783. By the hardening and tempering process the metal may sometimes be improved in value 50 per cent.; *ib.* 3800. The finished Whitworth 12-pr. is four times the expense of the material required to make it; *ib.* 3804-3807. Opinion that the cost of a projectile is more important than that of the gun; *ib.* 3810, 3811. Probability of the cost of steel coming down to 30*l.* per ton, and statement of the price of Bessemer steel to be now from 30*l.* to 40*l.* per ton; *ib.* 3813, 3814. The cost of the Whitworth gun as made from steel will always be more than the wrought-iron gun from the expensive nature of the material; *ib.* 3836; *Noble* 3427. As a question of economy there is no system so cheap as the polygonal when taken in connexion with the projectiles; *Whitworth* 4094-4097. Mention of the price of the 70-pr. Whitworth at 500*l.*; *ib.* 4131. Evidence of the cost of the steel barrels for Armstrong guns from 70*l.* to 120*l.* per ton according to the size of the barrel; *Noble* 3267. Cost of Bessemer steel for barrels would be about 50*l.* to 60*l.* per ton; *ib.* 3292. The value of the barrel when turned and bored would be 50 per cent. more than the original cost; *ib.* 3310, 3412-3427. The difference in the cost of coiled barrel and steel considerable; *ib.* 3404-3408. Statement of price of experimental 12-prs. as 254*l.* for the breech loader, and 226*l.* for the muzzle loader; the former cost of 12-pr. breech loader, 90*l.*; *ib.* 3437-3441. Evidence that Mr. Whitworth's price for 300-pr. is 3,000*l.*, while that gun is supplied by the Armstrong firm at 1,620*l.*, and opinion that it stands to reason the cost of the Armstrong should be the least, the material in it costing 20*l.* per ton against that for the other being 80*l.* per ton; *ib.* 3443. Cost of welding and working up wrought iron into coiled cylinders adds 50 per cent. on the value of the material; *ib.* 3454. The cost of the wrought iron now used in the gun factories for coils is from 12*l.* to 14*l.* per ton; and if found to answer will cheapen very much the manufacture of the Armstrong gun; *ib.* 3457. Mention of the cost of the finished barrel for 70-pr. Armstrong as 210*l.*, or three times the cost of the raw material; *ib.* 3594. Any system of rifling adds little to the cost of a gun; *ib.* 3607. The breech and muzzle-loading Armstrong 70-pr. quoted at the same price, the former being the lightest by about 15 cwt.; but as a rule the breech-loading apparatus is most expensive; *ib.* 3616-3619. The cost of the same kind of projectiles as supplied to the Committee would come to 25 to 30 per cent. less if supplied in large quantities; *ib.* 3626. The cost of tools to accompany 12-pr. Armstrong guns stated at 10*l.* to 12*l.* per set; *ib.* 3649. Instance of cost of 12-pr. segment shell as 2*s.* 10*d.* when supplied to the British Government. The charge to the Committee 4*s.* for segment shell, 3*s.* 6*d.* for common shell; cost of a time fuze, 2*s.* 6*d.* to 2*s.*; concussion fuze, 1*s.*; pillar fuze, 1*s.* 10*d.*; and an adapter, 6*d.*; *ib.* 3670-3679. Statement that experimental guns are high in price from requiring special tools for their manufacture; the tools for the first 600-pr. costing 800*l.*; *ib.* 3687. The cost of the first 110-pr. shell was 23*s.* 6*d.* each; they were afterwards supplied for 13*s.* each; *ib.* 3689. The steel makers charge 130*l.* per ton for the barrel for 600-pr., or 600*l.* for the whole; *ib.* 3691, 3707. Cost of the steel ingot for 300-pr. barrel is 300*l.*, for the 150-pr. it is 180*l.*; *ib.* 3696, 3707. Tabular statement of the cost of the Armstrong and Whitworth ordnance and projectiles; *App.* 159-161. Cost of the special tools for Armstrong guns; *App.* 164. Cost of alterations and repair to Armstrong guns as far as is known at Woolwich; *App.* 167-200.

## EXPERIMENTS:

Evidence of experiments at Shoeburyness for testing the rapidity of fire between Armstrong, Whitworth, and other guns; *Whitworth* 97-101; *Alderson* 625; *Taylor* 1480-1484. Experiments of the Select Committee to determine penetration into earthwork, masonry, and wood; *Taylor* 1547-1550; *App.* 158. Experiments in connexion with Captain Coles's cupola shield; *Liddell* 973-985; *Powell* 2299-2306, 2314-2326. Experiments to determine the strength necessary for breeching ropes for Armstrong broad-side guns; *Liddell* 1159-1166. Experiments carried on against iron plates; *Harrison*, *A.* 1404-1444. (See Analysis of his evidence.) Experiments to determine the best form for the Whitworth shrapnel shell;

*Boxer* 1570-1576. 1613-1615. Result of experiments with flat-headed projectiles; *Boxer* 1617, 1618, 1735; *Hay* 1859-1862. Evidence of submarine experiments; *Liddell* 1075-1087; *Hewlett* 2165-2181. Evidence of the experiments for ascertaining the torsional strain on different rifle barrels; *Hay* 1836; *Anderson* 2480-2483. Experiments between Armstrong and Whitworth 12-pr. guns at Shorncliffe; *Isacke* 2799-2867; *Best* 2868-2965.

Programme of experiments with field guns to be carried on by Armstrong and Whitworth Committee; *App.* 165.

#### COMPETITIVE EXPERIMENTS BEFORE COMMITTEE.

##### 12-pr. breech-loading Armstrong gun.

|                                                                                                                     | Appendix. |
|---------------------------------------------------------------------------------------------------------------------|-----------|
| Experiments for range and accuracy - -                                                                              | 252-261   |
| " for target practice - -                                                                                           | 262-265   |
| " against earthwork and abattis -                                                                                   | 266       |
| " against stockades, walls, field artillery, and rope mantlets -                                                    | 667       |
| " destructive effect of segment shell as common case - -                                                            | 268       |
| " Lieut. Reeve's common case -                                                                                      | 269       |
| " destructive effects of segment shell against targets - -                                                          | 271-281   |
| " with fuzes - - -                                                                                                  | 282       |
| " rough usage, and effect of premature bursting in the bore -                                                       | 283       |
| " rapid firing - - -                                                                                                | 284       |
| " Sir W. Armstrong's programme, with zincd and undercut projectiles, fuzes, and rapid firing sea service trials - - | 285-288   |
|                                                                                                                     | 289       |

##### 12-pr. Whitworth gun.

|                                                                                |         |
|--------------------------------------------------------------------------------|---------|
| Experiments for range and accuracy - -                                         | 291-302 |
| " target practice - - -                                                        | 303-306 |
| " against earthworks and abattis -                                             | 307     |
| " stockades, walls, field artillery, and rope mantlets - -                     | 308     |
| " destructive effect of Boxer's shrapnel shell - -                             | 309     |
| " destructive effect of Whitworth common case - - -                            | 310     |
| " Boxer's shrapnel shell against targets representing troops in position - - - | 312-324 |
| " with fuzes - - -                                                             | 325     |
| " rough usage and premature bursting of shell - -                              | 326     |
| " rapid firing - - -                                                           | 327     |
| " Mr. Whitworth's programme, rifled spheres, shot, and submarine practice - -  | 328-331 |
| " sea service trials - - -                                                     | 332     |

##### 12-pr. muzzle-loading Armstrong gun.

|                                                                                      |         |
|--------------------------------------------------------------------------------------|---------|
| Experiments for range and accuracy - -                                               | 333-344 |
| " target practice - - -                                                              | 345-348 |
| " against earthworks and abattis -                                                   | 349     |
| " stockades, walls, field artillery, and rope mantlets - -                           | 350     |
| " destructive effects of segment shell as common case - -                            | 351     |
| " Lieut. Reeve's common case -                                                       | 352     |
| " destructive effects against targets representing troops -                          | 354-363 |
| " with fuzes - - -                                                                   | 364     |
| " rough usage and effect of premature bursting of shell in the bore - - -            | 365     |
| " rapid firing - - -                                                                 | 366     |
| " sea service trials - - -                                                           | 367     |
| " initial velocity and retardation angles of descent of solid shot from 12-pr. - - - | 368-371 |
|                                                                                      | 372     |

#### EXTRACTOR:

Evidence of the necessity of having an extractor for removing the metal cartridge case in the Whitworth gun; *Whitworth* 95. 100; *Taylor* 1482.

#### F.

#### FACING OF ARMSTRONG GUNS AND BUSHING:

Evidence that where facing is used no copper cap is required, and states that wear in large guns is the cause of objection to their being faced; *Armstrong* 218, 219. Witness has never seen gunners sufficiently

instructed to enable them to face a gun without assistance; *Coz*, S. 348. Statement that some guns at Shorncliffe have fired 200 rounds before being refaced; *Coz*, J. 453. Observation that the necessity for facing varies according to the hardness of the copper, and that 250 would be the mean number of rounds before facing would be required. The lowest number would be 150; does not think facing any practical disadvantage, and any ordinary man can be trained to face in a couple of days; *Milman* 865-900. Witness does not see any difficulty in facing. Gives 150 rounds as the mean for refacing; *Liddell* 1043-1049. Evidence has found no difficulty in facing the copper ring in the chamber of the gun, but has found it difficult to face the vent-piece; *Bechervaise* 1267-1271. Witness states that he found no necessity to renew the bushing of his guns, but had faced them once, and had fired only 200 rounds; *Milward* 1392. Evidence states that the necessity of refacing the Armstrong guns does not weigh with him against the use of these guns; *Taylor* 1490. Witness gives an instance of the difficulty in supplying the proper pattern bouche rings for 110-pr. Armstrongs, and gives evidence of the complicated nature of the facing tools; *Gordon* 1756, 1757. 1797-1807. Evidence states that guns in the "Excellent" are refaced after 200 or 300 rounds (more or less), but some guns fire 600 or 700 without requiring it. Finds no difficulty in the operation; *Hewlett* 2145, 2146. Witness considers the copper bushing on the vent-piece and in the bore is very objectionable; *Anderson* 2514.

#### FAILURES. See FLAWS.

#### FIRE, THE EFFECT OF:

Statement that an artilleryman ought to put the whole of his fire from an Armstrong gun into a column of companies 3,000 yards distant; *Coz*, S. 237. 344, 345. Statement of the effect of fire of Armstrong's segment shell at 100 and 300 yards, and the dispersion of fragments from these projectiles; *Alderson* 604, 627. Opinion that at 3,000 yards range nearly the whole of the fire from an Armstrong gun should be delivered on a front of 50 yards, and out of 20 rounds a competent gunner should hit a six foot target 14 or 15 shots out of 20, and mentions a case of accurate firing; *Milman* 728, 729. 757, 761. Effect of the fire of Armstrong 12-pr. in China; *Milward* 1317-1322. 1333-1343. 1353-1358. 1383-1385. 1397; *Desborough* 1447. 1455. 1457-1459. 1464, 1465; *Harrison*, R. 1865-1868. 1875. 1880-1885. Evidence of the want of success in the firing the 12-pr. Armstrongs in New Zealand; *Seymour* 1993. 1995, 1996. Evidence as to the rapidity of fire possible with Armstrong guns. Fired five rounds in six minutes and a few seconds with 110-pr. With 70-pr. wedge gun fired 50 rounds in 32 minutes 32 seconds. Has seen 70 or 80 rounds fired from a 12-pr. in one day; *Coz*, J. 426. 540. 549, 550. Average time to fire five rounds from a 12-pr. was 3 minutes 40 or 50 seconds. With all detachments it would be about a round per minute; *Milman* 819, 820. 824. Rapidity of fire of Armstrong breech loaders is very great, except the 110-pr. Shortest time of firing six rounds in the "Excellent" is 3 minutes 45 seconds. From Captain Coles' cupola fired six rounds in 2 minutes 40 seconds. Fired from 40-pr. 100 rounds in 86 minutes; *Liddell* 1028. 1030. 1032. 1172. Evidence that the rapidity of the fire from Armstrong guns is sufficiently great; *Milward* 1363. Several instances of the rapidity of fire; *Taylor* 1542. The breech loader capable of more firing than the muzzle loader; *Hewlett* 2154. 2214. Evidence as to the rapidity of fire of the muzzle loader over the breech loader; *Coz*, S. 292. 383; *Coz*, J. 480; *Powell* 2285; *Gardner* 2606. The Armstrong wedge guns quicker in fire than the screw breech loader; *Coz*, J. 398. 540. The effect of fire from smooth-bore field guns more effective than from Armstrong 12-prs. when the men are hurried; *Gardner* 2701. The ranges of Armstrong and Whitworth guns about the same with equal charges; *Alderson* 707. Instance given of the rapidity of the fire from a Whitworth gun being about the same as a smooth bore, and a comparison of the rapidity between Armstrong and Whitworth guns at Shorncliffe; *Whitworth* 97-102; *Isacke* 2807. Statement of the irregular fire obtained from some Whitworth guns; *Best* 2901. 2903. Evidence that on the first trial between the Armstrong and Whitworth breech loaders that the Armstrong had the advantage of rapidity of fire,

but since the Whitworth muzzle loader has been introduced its speed is greater than Armstrong; *Taylor* 1481. 1485. Effect of ricochet fire bad with elongated shell, but with a suitable concussion fuze it would be well adapted for plunging fire; *Alderson* 680-682; *Hewlett* 2149; *Powell* 2307.

FLAT-HEADED PROJECTILES. See PROJECTILES.

#### FLAWS AND DEFECTS:

Witness observes the liability to internal flaws in steel barrels increases as the size of the barrel enlarges. In the early manufacture of the Armstrong gun it was a matter of difficulty to make perfect welds and turn out guns free from defects; *Armstrong* 126. 134. Opinion that the breech screws become injured from flaws; *Alderson* 588, 602. Witness states his readiness to furnish returns showing the number of Armstrong guns returned for defects, and observes that it would not be a satisfactory criterion of the proportion of guns which have become defective, as three-fourths of those issued have not been fired; *Gordon* 1748, 1749; *App.* 167-200. Evidence that in the early experiments with Armstrong guns flaws in the rifling were thought of more importance than they are now; *Hewlett* 2049. Statement of a preference for the Whitworth gun, as so many of the Armstrongs had burst, cracked, and gone in different ways; *Best* 2952. Witness states that to get an Armstrong gun free from defects inside it is requisite to have a pure iron; *Anderson* 2351. The longitudinal direction of the fibre in the solid forged barrels the cause of scorings in the bores of Armstrong guns; *ib.* 2358, 2459, 2460. Statement of the necessity of renewing the barrels of 160 12-prs. out of 360 in consequence of defects in the welding of their coiled barrels; *ib.* 2366-2368. Evidence that the defects in large forgings are always to be found near the centre; *ib.* 2441. Explanation of the defects of construction of the Armstrong 300-pr.; *ib.* 2488. Evidence of the flaws discovered in the 150-pr. before bursting; *ib.* 2496-2498. Statement of having seen coils separating, and is therefore inclined to prefer a solid gun; *Gardner* 2718. Evidence of the per-centage of failures from defects in Armstrong guns; *Anderson* 2967. Explanation that the 25 per cent. of failures from defects related merely to the inner barrels; *ib.* 3104. Failures in the outer coils not of serious importance; *ib.* 3109. Longitudinal fracture of 12-pr. gun at Shorncliffe can only be accounted for by the breech piece being imperfectly welded; *ib.* 3110, 3111. Report of the flaws found in four brass 12-pr. Whitworth guns after 200 rounds; *App.* 165. Evidence of a flaw in the bore of a brass Whitworth at Shorncliffe; *Cox, S.* 303; *Alderson* 619; *Taylor* 1500. Statement that the Armstrong guns submitted to the Committee have the material applied in a manner which best ensures the detection of dangerous flaws. *Letter of Sir. W. Armstrong, App.* 155. The flaws and defects in steel barrels considerable; *Noble* 3235-3246. 3328, 3329. Statement of the failures of the steel Whitworth guns made for the Viceroy of Egypt and the Government at Copenhagen, the damage done, and lives lost; *ib.* 3466-3470. 3517. Denial of the failures of the guns supplied by Mr. Whitworth to the Pasha of Egypt; *Whitworth* 3877-3886.

#### FORGINGS:

Mention made of the importance of introducing a barrel or inner tube into the Armstrong guns made from a solid mass of steel or homogeneous metal, and great difficulty has been found in obtaining this metal free from imperfections, and in consequence recourse has been had to wrought iron in coils, and also solid forgings bored out. But from the perfection attained up to the present, in the manufacture of steel, it is hoped the difficulties will be surmounted, as barrels made of the coil principle are often defective from imperfect welds, and also those of solid forged iron; *Armstrong* 123-125. 129-134. 137, 138. 204-206; *Anderson* 2407-2409. 2412-2414. 2418-2422. 2966. 2968, 2969. 3137; *Noble* 3235-3246. 3340-3353. 3476-3478. Witness states that out of 2,500 built up guns, he has made between 600 and 700 with a core on the solid plan, which is not nearly perfect, but considers it better than the coiled barrel; *Anderson* 2353. 2360. 2390. 2394. 2966. A large forging will not answer for guns from the imperfections which will be found in the centre; *ib.* 2382. 2436. 2439. 2441; *Noble* 3527-3529. Statement of the construction of the

breech piece of a solid forging, and the difficulties met with in attaining perfect soundness, and alleged superiority of the solid forged breech piece over the first method used in its construction; *Armstrong* 125; *Anderson* 2385-2389. 2433. Evidence that all trunnion pieces for Armstrong guns are made from solid forgings; *Anderson* 3125, 3126. Welds in the coils have only about 50 or 60 per cent. the strength of the original bar of wrought iron; *Noble* 3356.

#### 40-PR. ARMSTRONG GUN:

The 40-pr. proposed as a gun of position, and statement that witness would adhere to the existing construction of that gun; *Armstrong* 120. 127. Preference for the 40-pr. for siege purposes and on board ship, and general approval of that gun and its performance; *Alderson* 645. 690; *Milman* 787. 856. 857; *Liddell* 951. 974. 1004. 1037. 1091. 1159. 1163. 1172. 1176; *Bechervaise* 1207. 1274; *Hay* 1834. 1843; *Rice* 1935; *Hewlett* 2071; *Powell* 2319; *Gardner* 2634. 2749. Per-centage of failures during manufacture of the 40-prs.; *Anderson* 2967.

#### FOULING:

Witness mentions the necessity of water or oil to prevent fouling of the breech screw in Armstrong guns; *Cox, S.* 269; *Gardner* 2634. Statement that the introduction of the lubricator prevents fouling; *Cox, J.* 565. 575; *Alderson* 654; *Liddell* 1167, 1168. Witness states 100 rounds were fired from the Whitworth guns at Shorncliffe, and that washing out the bores was not done, although no lubricator was used, and opinion that to require lubrication is a defect in a system; *Whitworth* 83; *Boxer* 1578, 1579. Complaint of the fouling experienced with a 12-pr. Armstrong gun; *Boxer* 1633-1640. Complaint of the fouling in the Whitworth gun; *Hewlett* 2058. 2072, 2073. 2100. 2199.

#### FRICTION:

In the Whitworth gun the action of the gas wears the gun more than the friction of shot; *Whitworth* 103, 104; *Boxer* 1658. The forcing action in the Armstrong shot is not a continued friction all through the bore, but merely in the first movement; *Armstrong* 173. Importance of a soft metal coating on rifle projectiles to diminish friction; *Hay* 1836. 1838. 1843, 1849; *Hewlett* 2076. 2093. 2190. Witness is of opinion that the friction of a rifle projectile will not wear out a gun as long as there is plenty of bearing surface, and that there is enough of that for safety in both Armstrong and Whitworth guns, and considers the friction of hard metal projectiles is of no injury to the bore, would therefore prefer such projectiles, as those covered with soft metal deteriorate; witness, however, makes an exception to the above when shown a projectile fired from a brass Whitworth; *Anderson* 2472-2476. 3002. 3142-3144.

#### FUEL:

The importance of using fuel without impurities, such as sulphur and iron pyrites, in forging the Armstrong gun, and the care used to select the best Hartley coal; *Anderson* 2337. 3107, 3108.

#### FUZE:

In the Whitworth projectiles the common fuze of the service may be used, which is lighted by the flame of the discharge, and opinions that it is advantageous so to light a fuze; *Whitworth* 49, 50. 75; *Boxer* 1578; *Taylor* 1539; *Hewlett* 2195. Witness states that the common fuze of the service may be made available by the addition of a detonating arrangement; *Boxer* 1704. Opinion that if the Boxer fuze could be made available with Armstrong shells that it would be an advantage; *Gardner* 2733-2735. Evidence in approval of the new pattern Armstrong time and concussion fuze; *Armstrong* 161; *Cox, S.* 236-238. 260; *Alderson* 659, 660. 710; *Milman* 919, 920. 925; *Liddell* 1020; *Taylor* 1545; *Gardner* 2654. The premature bursting of some shells attributed to using the old pattern time fuze in combination with the new pattern concussion fuzes; *Armstrong* 139. The old pattern time fuze defective; *Armstrong* 161; *Milman* 921. 924; *Liddell* 1015-1018; *Bechervaise* 1291; *Milward* 1316; *Taylor* 1545; *Boxer* 1720; *Hewlett* 2122, 2123. Evidence as to the complication of the Armstrong fuze, and the probability of their not succeeding on service, and statement that the concussion fuze is not of much use; *Boxer* 1705-1707. 1710-1723; *Glyn* 1977. 1978; *Gardner* 2619. 2653. Opinion in favour of the Armstrong time

fuze from the facility of altering it when in shell; *Hewlett* 2218; *Powell* 2312. Experience favourable to the Armstrong fuzes; *Rice* 1924, 1925; *Powell* 2309, 2310. Statement of the advantage of having the time and concussion fuze in each shell; *Milman* 846; *Gardner* 2698. Statement made that the Moorsom composition does not deteriorate, and that it has been made use of in the manufacture of Armstrong pillar fuzes; *Boxer* 1729; *Gordon* 1826. Evidence in approval of the Armstrong pillar fuze; *Alderson* 720; *Milman* 929; *Hewlett* 2122, 2174, 2175; *Gardner* 2714-2716. Evidence that the pillar fuze is liable to accidents, and is considered too delicate, and statement of the accident in the store department, Woolwich, by the firing of a pillar fuze; *Boxer* 1725; *Gordon* 1812-8115; *Bent* 2759-2761. Recommendation not to screw the pillar fuzes into the shells until just wanted for firing; *Bent* 2760. Evidence of the accident on board the "Stork" from the premature firing of a time fuze; *Liddell* 1018. Statement that the fuze adapter is an advantage, and thinks that all fuzes should be of the same gauge; *Milman* 933, 934. Opinion that in consequence of the thread of the adapter being in an opposite direction to that of the fuze, that the latter drops out in the flight of the projectile; *Bechervaise* 1292, 1293. Evidence given as to the want felt for a fuze sufficiently sensitive for parapet firing with small charges; *Alderson* 684; *Liddell* 1020; *Hewlett* 2151; *Gardner* 2753. Success of the Armstrong concussion fuze in China against cavalry and also against parapets, owing to the thin nature of the latter; *Milward* 1317, 1338. Evidence that it was found in firing shell against iron plates, that fuzes were not required to fire the shell; *Harrison*, A. 1442, 1443. Evidence, that the Whitworth firm have now commenced to make their own fuzes on a similar plan to the Boxer fuze; *Whitworth* 4031-4034. Competitive experiments of fuzes with 12-pr. breech-loading Armstrong; *App.* 282, 288; with 12-pr. Whitworth; *App.*, 325; with 12-pr. muzzle-loading Armstrong; *App.*, 364.

#### G.

GARDNER, WILLIAM B., Colonel R.A. (*Analysis of evidence.*)

Is the chief instructor at Shoeburyness; has seen some practice with Whitworth guns, but with Armstrong fired about 600 rounds from the 12, 20, 40, and 110-prs. The 12-pr. has a good range and is remarkably accurate; 2603. The smaller calibre of this gun work easily; 2604. Prefers muzzle loaders for the field, but under cover and in casemates, and perhaps on board ship, breech loaders might be most useful; 2605. Muzzle loader best for rapid firing; 2606. Armstrong gun not adapted for firing molten iron, 2608. Does not consider 12-pr. a good gun for rough work, the breech-loading principle is superfluous in a field gun; 2611. Believes that the larger the calibre the greater the difficulty with the breech-loading apparatus; 2612. Thinks that the side-loading gun would be more easily worked than the breech loader; 2613. Does not think that 110-prs. are fit for coast defences against iron-clads; 2614. There is a very great want of a common shell for field guns; 2616. Rather inclined to keep the shell guns in distinct batteries; 2618. Considers the fuzes too complicated to act well; 2619. The number of tools carried by an Armstrong field battery an objection, would prefer a hard surface to projectiles if possible to make it very simple; 2626. Was told the projectiles suffered much in the limber boxes in Canada; 2627. The difficulty in working 110-pr. lies in the breech screw, lifting the vent-piece, and putting the shot in. The tin cups also cause a complication; 2638. Has known the vent-piece jam and break during firing; 2640. Colonel Barry says in his report on the guns in China, on one occasion the breech screws became jammed with rust; should consider that enough to condemn the guns. One of the vent-pieces was blown out; Major Hay states two vent-pieces were blown out, although assured by the men that the breech screw was properly screwed up, and the vent-pieces became so hot that it was difficult to hold them. Would not undertake to say that the new pattern vent piece would not blow out; 2645. If sand were to get on the breech screws they would not work; 2649. Considers the segment shell very formidable; 2651. Or. the whole the Armstrong projectiles are good; 2652. Believes india-rubber would

become injured in the time fuzes; 2653. New concussion fuzes act well; 2654. The system of sighting too complicated; 2656. Has seen about 18 accidents with the vent-pieces of all patterns, but never saw anyone injured by them; 2659. Men learn the drill easily with smaller natures of Armstrong gun, but not with 110-pr.; 2665. Trained artificers necessary for repairs to these guns; 2667. Oil very necessary to the working of breech screws; 2672. Strongly against breech loaders; 2679. Knew of three cases where guns had to be sent for repair, could not continue firing; 2685. Dangerous to touch a shell when stuck in the bore of a rifle gun; 2689. Considers it an advantage to have a time and concussion fuze to each shell; 2698. Found that at 800 yards with 9-pr. gun, and 24-pr. howitzer, that rather better practice was made by them than with 12-pr. Armstrong, the firing being quick and hurried in both cases; 2701. For sea defences, if it be a question of point blank range, would prefer the 68-pr. gun, or a large smooth bore, but not for a long range; 2704. Considers the "pillar" a formidable fuze; 2716. Considers coil system advantageous, as giving warning of its breaking up, but would prefer a solid gun if it could be made; 2718. A very great advantage to have one kind of projectile; 2721. Believes penetration a question of the material in the projectile; 2724. Takes longer to train men to breech-loading system than to the muzzle-loading; 2728. Would recommend batteries in the proportion of half rifled, and half smooth bore, 2730. Considers the Whitworth a wonderfully accurate gun; 2732. Would prefer the Boxer fuze if it could be used with the Armstrong projectile; 2733. Rifle guns immense advantage in sieges; 2748. A more sensitive concussion fuze required for enfilading fire with Armstrong guns; 2753.

#### GAS, ESCAPE OF:

Evidence that on the first trials of the Armstrong wedge gun that the escape of gas was considerable, but by the alterations introduced it was entirely obviated; *Armstrong* 126; *Cox*, S. 395; *Hewlett* 2078. Opinion given of the difficulty of securing the wedge gun from allowing of an escape of gas; *Anderson* 2565-2568. Evidence given that on board the "Excellent" it is considered best to reface after 150 rounds, because it is inconvenient to have an escape of gas, and an instance given of a considerable escape on one occasion; *Liddell* 1045, 1047, 1060. Statement that gas escape in Armstrong guns fouls the breech screw, and that all these guns are more or less liable to it; *Boxer* 1625, 1626. Evidence that although the vent-piece with projecting back would not be blown out, yet the escape of gas may be very great unless the breech screw is properly screwed up; *Hewlett* 2141. Witness gives an instance of an officer being singed by the escape of gas from a 40-pr. Armstrong; *Powell* 2253. Evidence of the difficulties met with in the use of the tin cups with the 110-pr. Armstrong to prevent the escape of gas, and instances given of their being the cause of jamming the vent-pieces; *Cox*, S. 368; *Alderson* 656; *Milman* 828, 830, 903-905; *Liddell* 1008-1014; *Bechervaise* 1209-1212; *Boxer* 1626; *Powell* 2294; *Gardner* 2638, 2639.

#### GAUGES:

Statement of the accuracy of dimensions attainable in the manufacture of projectiles in the Royal Laboratory, and of the necessity of a limit between high and low gauge being allowed, and information given that a considerable number of Armstrong shells sent to the Laboratory to be reloaded have their fuze holes out of the proper centre line; *Boxer* 1649-1651, 1676-1678. The importance of great accuracy of gauge in the tools used in the repair of Armstrong guns, and that no makeshift could be successfully employed to replace them; *Anderson* 2553, 2554. The necessity of great care in gauging the coils of the Armstrong gun to allow of the proper tension when shrunk on, and account of the accuracy with which it is done; *ib.* 3077-3079. Evidence of the labour entailed in gauging any Armstrong projectiles which have been moved about at all, from the alteration of shape in the soft metal to which they are liable; *Bent* 2779-2781.

#### GEAR AND TOOLS:

Witnesses complain of the inconvenience of carrying with Armstrong guns so much gear and tools; *Bechervaise* 1306; *Seymour* 2000; *Anderson* 2552; *Gardner*

2621. Evidence contends that the advantages gained by the Armstrong system are sufficient to counterbalance the inconvenience of carrying so many tools; *Taylor* 1490. Statement of the complicated nature of the tools necessary for Armstrong guns, and the difficulty of keeping the store supply correct, in consequence of the frequent changes of patterns. Mention made of the spare stores which will probably be required by these guns on issue; *Gordon* 1756-1759, 1764-1768, 1794, 1799, 1805, 1809. Evidence of the great accuracy required in the work to be performed by the tools to accompany Armstrong guns, and for the larger guns the tools to be carried are most formidable. It would be impossible to replace these tools if lost in the field. The tools required for the repair of the wedge Armstrong guns will require great exactness, as the repair of those guns is an operation requiring great care; *Anderson* 2552-2565. Returns of facing tools, spare articles, and implements for the use of the armourers detailed for the repair of Armstrong guns; *App.* 162-164. Evidence of the cost of the tools to accompany breech-loading Armstrong guns; *Noble* 3648-3650.

GLYN, HENRY C., Captain R.N. (*Analysis of evidence.*)

Has been on active service in New Zealand with the light 12-pr. Armstrong gun for boat service; it was useless, first, from its being too long, from the motion in the boat, and not fit for rough handling in landing on a beach. Applied for 12-pr. howitzer to supersede it; 1947. Considers a muzzle loader the best for boat service; 1955. Has no complaint against the ammunition, except some stripping of lead from shells; 1971. In manning boats one description of projectiles advantageous; 1975. Found that when men were flurried that the fuzes did not act well at short ranges; 1977. Accuracy no object for boat guns; 1984. The lead on our projectiles was put on by the tin process; 1990.

GORDON, HENRY WILLIAM, Captain, C.B. (*Analysis of evidence.*)

All guns issued for service, or those returned damaged, pass through my hands; 1745. Returns are no criterion by which to judge the proportion defective, as more than three-fourths of guns issued have not been fired; 1749. Approximately 2,900 Armstrong guns received; 1750. Guns returned for repairs are such as cannot be repaired at out-stations; 1751. Tools issued for repairs at stations, facing tools complicated, and almost impossible to keep pace with the changes of pattern of them; 1758. In old muzzle-loading smooth-bore guns venting tools only necessary, which are very expensive; 1759. The Whitworth guns have been experimental, a few only used, one of which, an 80-pr. breech-loading gun, became unserviceable; 1760. Wedge guns issued to Select Committee. Some going now for experiment at Portsmouth, Devonport, Sheerness, and Dover; 1761. They will require extra wedges and facing tools on issue for service in a proportion similar to that for vent-pieces; 1765. Out of three 70-prs. and two 40-prs. one of each had to be repaired after proof; 1772. Proving vent-pieces expensive, large number of guns destroyed by it; 1776. The inspection of projectiles rests with the Inspector of Artillery when made at Elswick. If at the Laboratory they are inspected there; 1781. Those unserviceable from the tin process cannot be reissued until modified; 1783. Order for fixing the lead by undercutting came out February 1861; but Elswick continued to supply those made by tin process until long afterwards. Zinc process first used at Laboratory; 1784. Tin process considered serviceable from December 1859 to February 1861; 1785. There have been no complaints against the process last introduced, and issued from about September 1861; 1786. Complaints received against the tin process from China; 1788. Elswick have just begun to use the zinc process; 1790. An immense number of shells, with which the tin process has been made use of, are still in the service on land and sea; 1792. Those from field artillery ordered to be exchanged; 1793. Will furnish return showing stores and tools required for one gun, considered as for ship or boat service, and for garrison or field artillery; 1795. Issues spare rings; 1796. The 110-pr. bouched in two different ways, viz., a thick or a thin ring. A demand made from two ships for rings could not be complied with, as the register number of guns was not sent to show whether the guns had thick or thin

rings; 1797. Guns now manufactured have the thin ring only, and if bouched before, have a thin ring now screwed into the thick one; 1798. This is a most delicate operation; 1799. The 110-pr. had originally no bouch, then copper, afterwards the thick, and now the thin ring; 1803. To describe vent-pieces, to form an opinion as to the cause of damage, it is necessary to state their number, whether made of iron or steel, and particular marks on it; 1808. Does not believe it possible to maintain supply to guns in event of operations on a large scale. In consequence of the frequent changes, 1809, would recommend the withdrawal of all ammunition that was not of the recognised pattern; 1810, 1811. Aware of one pillar fuze having exploded on removal to store; was one of the first made in Laboratory; 1812. Some shells from field batteries have been returned with their bases enlarged; could not load with them; caused to some extent by the limber box; 1821. When horse artillery changed their equipment, out of 1486 shells 394 unserviceable; 1822. No means of sufficient examination of Armstrong fuzes; 1828. Armstrong fuzes require great care in manufacture; 1830.

GRAPE. See CASESHOT AND GRAPE.

#### GUN FACTORIES:

For method of construction of the Armstrong guns at the Royal Gun Factories, Woolwich; *Anderson* 2327-2598, 2966-3224; *Noble* 3350-3353, 3472, 3586. Witness mentions that a cheap iron has been used in the gun factories for making coils, which will cheapen very much the manufacture of Armstrong guns; *ib.* 3457. Evidence that the cost of making the Armstrong guns can be ascertained at the Royal Arsenal, at the Gun Factories; *ib.* 3420, 3593. Witness states that a 120-pr. and a 70-pr. were made in the Gun Factories on the coil principle for Mr. Whitworth, and used by him at Shoeburyness; *Taylor* 1526-1528; *Anderson* 2485.

#### H.

##### HAMMER:

Evidence of the difficulty of welding thoroughly the coils in the Armstrong system, from the fact of their being unable to give them a good blow of the hammer, there not being rigidity enough in the structure; *Anderson* 2350, 2351. Method of hammering out the slabs to form the solid wrought-iron cylinder for the inner tube; *ib.* 2353, 2357. Inferiority of the welds in the first method of forming the breech piece from the want of proper hammering; *ib.* 2387. The ingots of steel for barrels of Armstrong guns is hammered and drawn out after receipt from the steel makers; *Noble* 3251, 3252. Evidence of the use of heavy hammers for the manufacture of homogeneous metal. (*Letter from Whitworth firm, App.* 201.)

HANDLES FOR VENT-PIECE. See HEATING.

HARRIER, H.M.S. See ACCIDENTS.

HARRISON, ARTHUR, Captain, R.A. (*Analysis of evidence.*)

Is secretary to Iron Plate Committee. Has seen all the experiments that have taken place with the Whitworth gun against iron plates; 1402. Mr. Whitworth's 70-pr. penetrated a 4-inch armour plate with 13 inches of wood backing, bursting inside the box target; 1405. Also penetrated 2½-inch unbacked armour with 12-pr. shot and shell; 1407. From his 120-pr., with an 130-lb. shell of homogeneous metal, penetrated the "Warrior" target, the plates on which were said to have been bad. Fresh plates were provided, and two shells weighing 151 lbs. each were burst in the wood backing, going through the plate, but gave little lateral damage. A shell of 130 lbs. also fired and apparently just burst as it penetrated the skin. 70-pr., at 600 yards, sent a shell of 81 lbs. through the plate, and it burst in the backing; 1410. Is of opinion that the penetration of armour plates is due to the quality of the metal in the projectile, always supposing the gun is able to stand a certain charge of powder, and is therefore of opinion that the Armstrong guns may be made to penetrate as well as the Whitworth; 1414. The Armstrong 110-pr. has penetrated with a shell the "Warrior" target, and bursting and blowing a hole through the skin, at a range of 200 yards; 1418.

the vent-piece will not stand a larger charge in the 110-pr. Armstrong, then the Whitworth gun ought to have the advantage in penetration. Saw one vent-piece break; it was not of new pattern; 1424. In the penetration of the Whitworth shell, a hole was merely punched through the plate; the fastenings were injured a good deal; 1428. Prefers muzzle-loading guns for penetration in consequence of the weakness of the vent-piece; 1435. In penetration no advantage in a flat-headed projectile; 1437. No fuze used in the bursting of either Armstrong or Whitworth shells against the iron plates; 1442.

HARRISON, RICHARD, Captain, R.E. (*Analysis of evidence.*)

Was with the force in China against the Peiho forts; 1863. Saw the Armstrong guns in action at Sinho route the Chinese cavalry at 1,200 yards' range; 1865. Saw 13 men and some horses killed by one shell with concussion fuze; 1866. Against the fortified village of Tangku the Armstrong shells most destructive to the Chinese behind their thin parapets; 1877. The guns opened first at 1,000 yards, then advanced to 600 yards; 1880. The impression on the army was that the Armstrong guns produced the most destructive effects; 1888. Before the action with Tartar cavalry, these guns had much knocking about in muddy roads in the most terrible way, notwithstanding which they opened fire when required; 1896.

HAY, CAPTAIN SIR JOHN C. D., BART., M.P., R.N. (*Analysis of evidence.*)

Having been chairman of the Iron Plate Committee, considers the comparative efficacy of the Armstrong and Whitworth guns against iron plates depends on their enduring powers in bearing the heaviest charges and giving the highest velocities, as the effect produced is due to the work of the shot on reaching the plate, together with the material of which the shot is made; 1832. Thinks that there are advantages in breech-loading in heavy guns, but want of confidence in them renders their use open to grave objection. Up to the 40-pr. breech loaders may be used with success; 1834. Considers it important that rifling projectiles should be coated with soft metal to prevent undue torsional friction on the metal of the gun; 1836. Would prefer rifle guns for the broadside, inasmuch as they perform the duty of the smooth bore, and give the accuracy and range of the rifle; 1840. As  $4\frac{1}{2}$ -inch plates on ships are invulnerable to small artillery, the limit of weight of a broadside gun cannot be put at much less than five tons, and thinks it would be safer to have them as muzzle loaders; 1841. For any service prefers the breech to muzzle loader if they could be made of endurance; 1844. Believes the shunt principle of rifling to be satisfactory; 1848. Thinks that the accuracy of fit given to the Whitworth projectile has done away the difficulty of loading with it; 1849. The Whitworth sabot prevents the shot moving from the charge; 1850. The displacement of a ship the means of limiting the size of her guns; 1852. Mr. Whitworth's shell, which has been driven through a ship's side, does not convey sufficient bursting charge; its merit consists in having had as a hollow projectile sufficient hardness and toughness to get through the iron plate without fracture; 1856. There are advantages in a flat-headed shot for penetration, when the flat part is considerably less in diameter than the shot, as it bites against iron plates when they are inclined at great angles; but if the plates be vertical there is no advantage; 1859. Experiments with iron plates tend to show that their resisting power is not materially increased by inclination 1862.

#### HEATING:

Witness observes that the heating caused from firing Armstrong guns would not render the coils slack from expansion; *Armstrong* 220, 221. Evidence of the inconvenience arising from the vent-pieces getting heated from rapid firing; *Cox, S.*, 335; *Cox, J.* 454; *Gardner* 2645. The addition of handles to the new pattern vent-pieces obviates the inconvenience felt from the heating; *Cox, J.* 458; *Liddell* 1175. The injurious effect of heating the breech piece so often in the welding, tending to make the metal granular and of inferior strength; *Anderson* 2399, 2433. Method of removing the outer coils by heating as pursued in the gun factories; *ib.* 2453.

HEWLETT, RICHARD S., Captain R.N., C.B. (*Analysis of evidence.*)

Commands H.M.S. "Excellent." Has had a great deal of practice with the Armstrong gun and some with the Whitworth; 2048. Has the highest opinion of the Armstrong gun as to safety, range, and accuracy. Believes that in the excitement of action the men may forget to screw up the breech piece. Has a 110-pr. in the "Excellent," in which four shells burst. Was easily repaired, and not by a specially instructed mechanic. Is still used with equal accuracy and range; 2049. The Armstrong has a number of advantages over the muzzle loader. Doubt the safety of the Whitworth gun, and considered its breech loading arrangements defective; 2051. Believes the principle of hard metal bearings in projectiles and guns with a severe twist will not stand long. With Whitworth's muzzle loader, found it difficult to get the shot home after a few rounds; 2052. Powder deposit getting into the angles of the rifling and hardening there the cause of difficulty in loading, although using sponge and lubricators; 2058. Notwithstanding the windage being small the shot started from its place in running the gun out, rendering a wad necessary; 2060. Practised with the Whitworth gun somewhat less than 30 rounds; 2063. Tried Mr. Whitworth's 80-pr. of homogeneous metal, which split after 20 or 30 rounds; 2068. On firing from Mr. Whitworth's cast-iron gun it became necessary to use the jolly boat's mast to get the shot home from the fouling in its bore; 2072. Considers the lead coating to Armstrong shot not objectionable, and believes all rifle projectiles should have soft outer skin. Considers it proved that the shot jamming in the Whitworth gun caused their bursting; 2076. Prefers the wedge Armstrongs to the screw breech loaders. Considers that system would be an improvement for the smaller naval guns, and for all others if the wedges can stand large charges; 2078. Two men can lift the vent piece of a 110-pr. with the greatest ease; 2082. Would not have a broadside gun of more than six tons; 2083. Considers that a pivot gun worked in the ordinary manner should not exceed five tons, but with mechanical arrangements, such as the cupola, there appears no limit in weight; 2084. Thinks it justifiable to bear with inconvenience in a gun when it secures perfect accuracy, although it is not so important at sea as on shore; 2091. Prefers breech to muzzle loaders, except for special purposes, such as smashing iron plates; 2092. Believes the manufacture of the Whitworth guns and projectiles could not be made so perfect as to prevent jamming in the bore; 2098. Considers the sponge cannot remove the fouling in the Whitworth guns; 2102. No difficulty in loading the Whitworth breech loader, but considers the same inconvenience will arise in them from the fouling; 2104. Considers the Armstrong a very good boat gun; 2110. Does not occupy more room in boats than the old gun—is in fact less in the way; 2112. No difficulty in landing with them, taking the sights out of the way; 2113. Prefers 20-pr. Armstrong to the old 24-pr. howitzer. Disagrees entirely with the evidence (of Captain H. C. Glyn 1947, Captain Seymour 2018) which states that four oars out of 14 had to be sacrificed to use the 12-pr. Armstrong for boat service. This gun has been shortened; 2118. Believes a combination of 12 and 20-pr. Armstrong in a field battery would be advantageous; 2121. The pillar fuzes have answered very well. The old pattern time fuzes deteriorate, and are irregular; 2122. The men in the "Excellent" appear to have perfect confidence in the Armstrong gun; 2131. Had three vent-pieces blown out, and about eight broken from firing; 2134. The projection on new pattern vent-piece ensures their not being blown out; 2141. Re-surface the copper rings of vent-pieces after 200 or 300 rounds, but some guns go on firing 600 or 700 without requiring it; 2145. fired 1,000 rounds from a 40-pr. Armstrong which was perfectly serviceable after it; 2147. Would not arm a ship altogether with rifle guns. The largest portion should be smooth bores. A more sensitive fuze required for parapet firing with Armstrong gun; 2151. Considers the breech loader infinitely more rapid in firing than the muzzle loader, under some circumstances, and under all has the advantage; 2154. Considers the coil system in guns an element of confidence, and if the vent-piece can be made indestructible can see no fault that could be found with the 110-pr. Armstrong; 2158. The breech screws stripped, but nothing to speak of; 2159. 110-

pr. Armstrong gun penetrated 20 to 22 inches of wood under water at a distance of 20 or 25 feet, and a three-inch iron plate at 20 feet; 2166. The penetration of the Whitworth flat-headed shot into water very good when fired from above the surface; 2168. Firing the Armstrong gun under water did not injure it; 2172. The effect of shell fired under water with pillar fuze at 20 feet range very great; 2174. Does not think Armstrong segment shell effective at very short ranges of about 150 yards and under; 2192. Would prefer a fuze lighted by the flame of the discharge if possible; 2195. At first great numbers of Armstrong shot stripped, but not latterly; 2204. Found no bad results from the smoke in firing Armstrong guns in the "Excellent;" 2210. Armstrong gun capable of bearing continued and rapid firing. Fired 100 rounds with one in 80 minutes; 2212. Likes the Armstrong time fuze better than the Boxer, because it can be set when in the shell; 2218.

HEXAGONAL. See RIFLING.

HOMOGENEOUS METAL. See STEEL.

#### HOOPING:

Witness believes that the defects in cast-iron guns might be got over if hooping were properly applied to them; *Anderson* 2333. Evidence that in putting on the Whitworth steel hoops cold by the hydraulic press that the full strength may be got out of them, if sufficient pressure be given to get them on conically, but it is not so simple or economical a plan as the shrinking on; *ib.* 3090. 3101, 3102. Evidence that no hoop will prevent the inner barrel from bursting; *Noble* 3505. Statement in disapproval of Mr. Whitworth's method of placing on the steel hoops by hydraulic pressure, and evidence of the Whitworth barrels turning round and spiking the gun: *ib.* 3562. Evidence considers that an extra hoop is required to the Whitworth gun when the vent is from above instead of in the prolongation of the gun's axis; *Whitworth* 3750-3753. Statement of the method of putting on the hoops of the Whitworth gun by hydraulic pressure; *ib.* 3894-3904. Denial that the barrels turn round, and thus spike the guns, and that the pressure on putting on the hoops is enough to prevent it; *ib.* 3907-3910. 4067-4069.

#### HORSFALL GUN:

Witness states that the most smashing effects he has seen against iron plates were produced by the Horsfall gun; *Gardner* 2722.

#### HOWITZERS AND SHELL GUNS:

Intention of witness to propose a shell gun or howitzer for field service, the details of which had not yet been worked out; *Whitworth* 26-34. Witness proposes as a howitzer the 20-pr. Armstrong of 13 cwt. for the field, and a 7-inch howitzer for siege purposes; *Armstrong* 194. Evidence of the want felt in existing field artillery equipments of an effective shell gun to act either in conjunction with the 12-pr. Armstrong or in distinct batteries, and recommendation that the short 20-pr. Armstrong should be adopted for field artillery; *Alderson* 605. 713, 714; *Milman* 842-844; *Milward* 1322-1329; *Desborough* 1447-1450. 1466; *Boxer* 1586, 1587; *Hewlett* 2121; *Gardner* 2616-2618. Statement made that a smooth-bore howitzer is more effective for boat service than the 12-pr. Armstrong; *Glyn* 1981; *Seymour* 2018.

HYDRAULIC PRESSURE. See HOOPING.

#### I.

IMPLEMENTS. See GEAR AND TOOLS.

IMPROVEMENTS. See ALTERATIONS.

INDIA-RUBBER RING. See FUZE.

INITIAL VELOCITY. See VELOCITY.

INNER TUBES, OR BARRELS. See FORGING.

#### INSPECTION AND PROOF:

The inspection and proof of Armstrong gun ammunition, formed almost entirely the witness's experience in the use of those guns, and was chiefly confined to the 12-pr.; *Boxer* 1569, 1570. Witness as Superintendent of the Royal Laboratory has nothing to do with the Armstrong projectiles made at Elswick, unless for repairs or alterations, they being inspected by the Inspector of Artillery; *ib.* 1679, 1680. In the

event of a return being required showing the number of rounds fired by an Armstrong gun the Inspector of Artillery could supply that information; *Gordon* 1749. The proof of vent-pieces stated to be an expensive business in consequence of their number being in excess of the guns, each requiring to be proved with full service charge; *ib.* 1775-1780. The inspections of Armstrong projectiles made at Elswick is done by the Inspector of Artillery, and those made at the Royal Laboratory are inspected by the Laboratory; *ib.* 1781. Statement of the proof charge of a 12-pr. Armstrong gun, and opinion expressed that a properly made gun of this system cannot be burst; *Armstrong* 136. Witness gives information of the numerous particulars and failures in the proof of the Armstrong guns at the Royal Gun Factories, and the care necessary in the inspection; *Anderson* 2359. 2364-2367. 2408. 2967. 3114. Evidence that heavy proof charges are injurious to an Armstrong gun as bringing the charge too far forward, and causing a strain to take place on a part of the gun not intended to bear it; *ib.* 2501. Detail of inspection of four brass Whitworth 12-prs. after experimental practice; *App.* 165. (See further at "Returns of examination.") Returns showing the number of guns proved and passed into the service at Elswick and the Royal Gun Factories; *App.* 164, 165. The inspection and proof of the steel for barrels of Armstrong guns very severe, a great number of barrels condemned, the uncertainty increases with the calibre; *Noble* 3231-3246. 3251-3258. Inspection made by the Whitworth firm of the steel barrels bought by them; *Whitworth* 3729. 3771-3776. 3787.

#### IRON, CAST:

Evidence of the want of safety felt in the use of cast-iron ordnance; *Liddell* 1149. There are many good points in cast iron for the construction of guns, the great defect is its uncertainty. Cast iron has not been properly applied yet, and might be turned to very good account if we could not get something better; *Anderson* 2329-2333. Method of making cast into wrought iron, by Morris and Sterling's patent; *ib.* 3096. Evidence that cast-iron guns with wrought-iron coils over them have burst largely; *Noble* 3520. 3525.

IRON PLATES. See PENETRATION.

#### IRON, WROUGHT:

The method of using wrought iron in bars on the coil principle is a good method of calling into action the full strength of that metal in the circumferential direction, but from the difficulty of welding, the longitudinal strength is not so great. It is, however, well adapted for the outer coils of guns, as from defects in welding, impurities in the metal or in the fuel used, it has been found that the barrels were often liable to imperfections in the bore; *Armstrong* 123. 136; *Anderson* 2350-2598. 2966-3224. Wrought iron much more easily welded than steel, and better suited to the exterior of guns; *Noble* 3340, 3341. In large masses of wrought iron uncertainty of quality exists; *Noble* 3339-3345. (See Forging and Hammer.) Witness would prefer inferior wrought iron to steel for outer coils; *ib.* 3502, 3503. The inferior wrought iron can be made up for in weight; *ib.* 3507. Statement that wrought-iron shot are no use for penetration of iron plates; *Whitworth* 4009-4013.

ISACKE, HENRY, Lieutenant R.A. (*Analysis of evidence.*)

I have seen practice with Armstrong and Whitworth guns; 2800. Four brass 12-pr. Whitworths fired 150 rounds each at ranges from 500 to 2,000 yards. They did not appear to have worn very much after firing, and were worked very easily; 2804. Twenty rounds were fired by one Whitworth in 13 minutes 40 seconds and beat the Armstrong by about one minute; 2807. Shot and shell were both fired. The Boxer fuze was used for the Whitworth shell; the concussion fuzes of the Armstrong shell were the most accurate; 2813. One or two fuses failed to ignite from the Whitworth gun; 2817. Did not think that the result of Boxer's shrapnel, as prepared for the Whitworth gun, was equal in effect to the Armstrong projectile; 2821. These shells travelled some distance after the explosion of their fuze in some instances; 2824. No difficulty in loading with hexagonal shot; 2825. No difficulty in sponging the Whitworth gun; 2834. Accuracy of the Whitworth gun very good; 2854. The Whitworth easier to work than the Armstrong gun to the men; 2859.

## K.

## KRUPP'S METAL AND GUNS:

Evidence given of the admirable quality of Krupp's steel, although too soft for the bores of guns. Opinion that the Bockum metal, from near Krupp's works, is as good as anything the witness has seen; *Anderson* 3012. 3098-3100. Mention made of the construction of the Krupp breech-loading gun, and favourable opinion given of its wedge and sunk steel cup; *ib.* 2971. 2990. Krupp supplies both the Armstrong and Whitworth firms with some of the steel used by them for their guns, and is the most expensive maker; *Noble* 3235. 3709; *Whitworth* 3728. Krupp's method of using large masses of steel for guns a failure; *Noble* 3517; *Whitworth* 3952-3954. 3961.

## L.

## LABORATORY:

Evidence that the projectiles manufactured at the Royal Laboratory are inspected and passed into the service by that department. Those made at Elswick are inspected by the Inspector of Artillery, the Royal Laboratory having nothing to do with them except for alterations or repair; *Boxer* 1679-1682; *Gordon* 1781. Statement of 100,000 Armstrong projectiles being sent to the Laboratory for reloading; *Boxer* 1677. Witness states that Colonel Boxer has had under consideration the form for shrapnel shell for the Whitworth gun; *Whitworth* 114, 115. Evidence of the Royal Laboratory having adopted the zincing process for fixing on the lead-coating of Armstrong projectiles, on Mr. Bashley Britten's system, opinion of its having been considered economical at the Laboratory although not found to be the case at Elswick; *Boxer* 1681-1687; *Gordon* 1784-1791; *Noble* 3632-3636. Letter requesting authority that the ammunition required for the trial of the Armstrong guns should be made at Elswick and not at the Royal Laboratory; *App.* 155. Letter from Whitworth firm respecting common shell sent to the Royal Laboratory; *App.* 202. Letter respecting the test for fuzes considered necessary by Colonel Boxer, superintendent of the Royal Laboratory; *App.* 203. Letter objecting to the superintendent of the Royal Laboratory withdrawing ammunition which had been supplied for the competitive trial of the Armstrong and Whitworth guns; *App.* 203. Letter from the superintendent Royal Laboratory submitting remarks for the consideration of the Committee on the ammunition for the Whitworth guns, supplied from the Laboratory; *App.* 203. Letter objecting to the shell supplied by Colonel Boxer for the Whitworth gun, from his being allowed to use alternative charges for bursting these shells; *App.* 204. Minutes and correspondence relative to shells requested to be made by Colonel Boxer for the use of the Armstrong gun: complaint of Mr. Whitworth for the same being allowed by the Secretary of State for War: and statement of Colonel Boxer that he is the inventor of the said shells, and not Mr. Whitworth: reconsideration of the permission given for Sir Wm. Armstrong to use the Whitworth shell; *App.* 205, 206. Letter objecting to Whitworth projectiles being placed for competition which had been perfected during the trials of the Committee; *App.* 206.

## LANCASTER GUNS:

Evidence of the bursting of two Lancaster guns at Kinburn; *Seymour* 2033. A comparison of the Lancaster gun taken with other rifle guns, to show that from the former having the greatest tendency to burst, the fact of its standing at all is a proof of the strength which may be expected from the others; *Hay* 1836; *Anderson* 2477-2480. Statement of the great amount of work done by the muzzles of the Lancaster guns, as tending to destroy them; *Anderson* 3168.

## LEAD-COATING TO PROJECTILES. See COATING.

## LENGTH:

Witness gives the length of the 1, 9, and 12-pr. Whitworth guns, and considers length in a gun an important element from its giving a low trajectory; *Whitworth* 5. 9. 71-73. Opinion given of the considerations which should limit the length of a gun; *Armstrong* 169-171. Statement that the 12-pr. Armstrong gun is inconveniently long to dismount, unless a hole is dug in front of the muzzle; *Cox*, S. 325. Witness thinks the 12-pr. Armstrong could be shortened with advantage, and although the naval short 12-pr. loses

a little in range yet it is a handier gun; *Alderson* 634, 635. Evidence that the Armstrong gun is too long for boat service; *Glyn* 1947; *Seymour* 2017. Tabular statements of the lengths of the Armstrong and Whitworth guns manufactured; *App.* 129-131. Evidence of the steel barrels for the Armstrong guns being supplied by the steel makers in certain lengths exceeding that required for the gun; *Anderson* 3010; *Noble* 3251. Lengths of the competitive 12-pr. guns (Armstrong and Whitworth); *App.* 209. 291. 333. Advantage of shortening the 12-pr. Armstrong for naval service; *Anderson* 2398.

## LEVER AND TAPPET RING:

Witness mentions that the keep pins for the tappet ring sometimes come out; *Cox*, S. 282. Evidence considers that the contingency of the lever being struck by an enemy's shot is the only serious objection to the Armstrong breech-loader; *Taylor* 1493. Witnesses conceive that if the breech-screw or lever handles were struck by a shot it would disable the gun: and a case was mentioned on board the "Defence," of the lever handle being knocked off by the recoil; *Milman* 918; *Powell* 2255, 2256. Evidence mentions the difficulty of sometimes working the tappet-ring; *Liddell* 1023-1026.

## LETTERS, MINUTES AND CORRESPONDENCE:

To the Secretary A. and W. Committee. From Sir W. Armstrong.

- 1st. January 17th, 1863. Forwarding tabulated statement (p. 160) of the various guns, &c. proposed by the Elswick Ordnance Company; *App.* 155.
- 2nd. January 21st, 1863. Request that the ammunition for the Armstrong guns under trial should be allowed to be made at Elswick; *App.* 155.
- 3rd. January 26th, 1863. Forwarding another tabular statement (p. 159) with a general description of the guns proposed; *App.* 155.
- 4th. February 26th, 1863. Requesting authority to furnish two new guns from Elswick in addition to one already supplied from Woolwich. Objection made to a contrast being made between the 70-pr. Armstrong of 60 cwt. and the 70-pr. Whitworth of 80 cwt. for the penetration of iron plates; *App.* 202.
- 5th. October 27th, 1863. Proposing  $6\frac{1}{2}$ -ton and 12-ton guns to be used against iron plates, the first with 68-pr., the latter with the 10-inch bore; *App.* 202.
- 6th. January 25th, 1864. Statement that each competitor should deliver their guns and ammunition before the trials commenced; *App.* 203.
- 7th. January 25th, 1864. Remarks on the testing of fuzes, and request to be allowed to submit less sensitive fuzes, capable of bearing the test; *App.* 203.
- 8th. April 6th, 1864. Objecting to Colonel Boxer withdrawing for experiment some of the ammunition supplied for the Whitworth gun; *App.* 203.
- 9th. June 16th, 1864. Objecting to the Boxer shell for the Whitworth being allowed two bursting charges; *App.* 204.
- 10th. September 10th, 1864. Request to be allowed to use the Boxer elongated shrapnel for 12-pr. shunt gun; *App.* 204.
- 11th. October 17th, 1864. Application to the Committee for 12-pr. gun, for Colonel Boxer to try experiments with shrapnel shell; *App.* 205.
- 12th. October 19th, 1864. Observing that two different kinds of shells were permitted for the 70-pr. Whitworth, contrary to previous agreement; *App.* 206.
- 13th. October 19th, 1864. Objection to 12-pr. case shot having been supplied by Mr. Whitworth after the specified time, and placed in competition with Armstrong case shot; *App.* 206.
- 14th. October 26th, 1864. Objection to the trial for rough usage for the Armstrong projectiles, they being packed with the Whitworth shot, and liable to damage thereby, more than when placed together by themselves; *App.* 206.
- 15th. November 1st, 1864. Further objections on the subject of letter No. 13; *App.* 206.
- 16th. November 7th, 1864. Statement that verbal application had been made to allow of more windage to the 70-pr.; *App.* 206.

- 17th. November 17th, 1864. Complaint that Mr. Whitworth had been allowed to use two natures of shell; *App.* 206.
- 18th. November 21st, 1864. Request that the incomplete practice of the 70-pr. in the marshes, should be struck out of the records of the Committee; *App.* 206.
- 19th. December 16th, 1864. Further objections on the subject of letters Nos. 13 and 15; *App.* 207.

*To the Secretary A. and W. Committee. From Joseph Whitworth, Esq.*

- 1st. January 24th, 1863. Relative to the tabular statement of the Whitworth guns rendered to the Committee, and proposal of the 12-pr. and 70-pr. for competition; *App.* 157.
- 2nd. January 29th, 1863. Regarding the inspection by the Committee of the manufacture of the Whitworth guns; *App.* 201.
- 3rd. February 17th, 1863. Acknowledgment of the order for the manufacture of three 12-prs., and three 70-prs.; *App.* 201.
- 4th. June 17th, 1863. Relative to the delay in the delivery of the Whitworth guns for trial; *App.* 201.
- 5th. September 4th, 1863. Statement that the Whitworth guns would be ready for delivery in three or four weeks; *App.* 201.
- 6th. October 2nd, 1863. Relative to ammunition to be supplied by the Royal Laboratory, and carriages by the Royal Carriage Department; *App.* 201.
- 7th. December 17th, 1863. Relative to the delay in supplying 70-pr.; *App.* 201.
- 8th. January 26th, 1864. Regarding the delivery of the Whitworth guns; *App.* 201.
- 9th. February 5th, 1864. Relative to the delivery on the 14th March of the Whitworth competitive guns; *App.* 202.
- 10th. March 14th, 1864. Advice of the despatch of the Whitworth guns and ammunition; *App.* 202.

*To the Secretary of State for War. From Joseph Whitworth, Esq.*

- 1st. December 25th, 1862. A comparison of the Armstrong and Whitworth systems of ordnance; *App.* 157.
- 2nd. January 12th, 1864. Relative to bill for the stores supplied to the A. and W. Committee, and notice of delivery of heavy guns; *App.* 201.
- 3rd. January 28th, 1864. Request that 10 rounds of case shot be supplied for 12-pr. Whitworth. Statement that it was not possible to deliver the 70-prs. at the required date; *App.* 201.
- 4th. October 27th, 1864. Objection to the shrapnel shell invented for the Whitworth gun, being used for the Armstrong gun; *App.* 204.

*Ordnance Select Committee. To the A. and W. Committee.*

- January 19, 1863. Forwarding memorandum of the experiments for penetration of Armstrong and Whitworth projectiles; *App.* 157.

*A. and W. Committee. From Chemist of the War Department.*

- January 23rd, 1865. Statement of the chemical examination of the runnion piece of a Whitworth gun; *App.* 202.

*A. and W. Committee. From Lieut.-Colonel Boxer, R.A.*

- 1st. April 29th, 1864. Suggestions as to the trial of the ammunition supplied for the Whitworth guns; *App.* 203.
- 2nd. August 29th, 1864. Statement that the principal of construction of the Whitworth shrapnel is equally applicable to the Armstrong gun; *App.* 204.

*A. and W. Committee. From Major-General St. George, Director of Ordnance.*

- February 27th, 1864. Statement of 1st April being the date fixed for the competitive guns being delivered; *App.* 203.

*Major-General St. George. To Joseph Whitworth, Esq.*

- 1st. November 28th, 1864. Statement that Mr. Whitworth had nothing to complain of in his shell being used for the Armstrong gun; *App.* 205.

- 2nd. December 6th, 1864. Further correspondence respecting the Whitworth shell being used with Armstrong gun, and withdrawal of the permission; *App.* 205.

*Major-General St. George. To Sir W. Armstrong.*

- December 6th, 1864. Decision that the Whitworth shell cannot be supplied for the use of the Armstrong gun; *App.* 205.

*Secretary of State for War. From Sir W. Armstrong.*

- September 18th, 1864. Application for a supply of the Boxer shrapnel for the Whitworth gun, to be supplied for the Armstrong shunt gun; *App.* 204.

*Superintendent Royal Gun Factory and Secretary A. and W. Committee.*

- Letters, 26th April, 29th April, 2nd May, 1864, relative to the correction of the sighting of the competitive Armstrong and Whitworth guns; *App.* 208, 209.

#### LIABILITY TO INJURY:

General evidence of breech-loading guns being more liable to injury than muzzle-loading; *Cox, J.* 449. 467. 476; *Milman* 917; *Powell* 2255; Witness states there is no danger to the crew in loading a breech-loading Armstrong, but in firing, thinks the liability to accident rests with that kind of gun; *Rice* 1915.

LIDDELL, WILLIAM HENRY, Lieut., R.N. (*Analysis of evidence.*)

Is first and gunnery lieutenant of the "Excellent." Has seen all kinds of Armstrong guns fired except 6-pr.; believes their range equal to the wants of the service, and thinks that if the range were longer the trajectory would be lower; 946. Accuracy of these guns of all natures very good; 953. Prefers the Armstrongs to others as boat guns; 970. Also as pivots, for accuracy; 972. And is the best gun for cupolas, if it would do for penetration, 974. Seamen under instruction generally are convinced of its accuracy; 975. The disadvantage of the Armstrong breech-loader is the liability of the vent-piece being blown out; 989. The vent-pieces crack; 995. The 40-pr. Armstrong admirable as a broadside gun; 1004. A few instances occurred where the shot did not take the rifling from not being home on the charge; 1005. The tin cups cause vent-pieces to jam sometimes; 1008. Old pattern time fuze acts badly; 1016. Also dangerous if the shell receives a fall; accident in the "Stork"; 1018. A fuze is required to explode shell dropped over a parapet with a small charge; 1020. Tappet-ring difficult to work after a few rounds; 1023. With the exception of the 110-pr. the rapidity of fire from Armstrong guns greater than smooth-bores; 1028. With the 40-pr. saw six rounds fired in 2 minutes 40 seconds; 1032. Breech-loaders advantageous on board ship; 1041. The men had no difficulty in taking out the vent-piece of the 110-pr.; 1052. Apprehends no difficulty with vent-piece when clearing for action at night; 1055. Armstrong breech-loader capable of standing rough usage at sea; knows no reason why they should not be used on the roughest service; 1064. A difficulty in dismounting heavy Armstrong guns; 1066. Prefers breech-loader to muzzle-loader; 1072. Found common shot give more penetration under water than any other; 1080. Could not hit a ship below the water-line by a gun fired from above it, with the amount of depression possible on naval carriages, of 7° to 8°; 1084. Armstrong projectiles have greater destructive effect than the 68-pr.; 1089. All Armstrong projectiles satisfactory, except the 110-pr.; 1096. Projectiles liable to injury in transmission, but not generally serious; 1098. Objects to material and shape of 110-pr. projectile; 1109. Two or three shells we fired with reduced charges in 110-pr. burst in the gun; 1128. For the field and in boat guns, great advantage of one kind of projectile; 1133. The old rectangular thread on the breech-screw was defective, the new pattern is not so; 1147. Great feeling of security given by wrought-iron coiled guns; 1149. Breaking thread of breech-screw caused by firing in one instance; 1157. Recoil of 40-pr. little more than 8-inch gun; 1159. Breeching rope of eight inches for 40-pr. the same as used for 32-pr. smooth-bore; 1165. The 68-pr. and 10-inch have greater recoil than 110-pr.; 1166. Saw a 40-pr. fire 100 rounds in 86 minutes; the vent-piece did not get

too hot, but the copper ring came off after about 80 rounds; the gun was pointed each time, and the shooting was good; 1172. The 40-pr. Armstrong, as compared with the 32-pr. smooth-bore gun, requires less room for stowing ammunition; 1188.

#### LINED GUNS:

Statement that steel-lined guns should not be supposed to have merely a thin lining, but consist of the entire inner tube of steel, introduced instead of one made of wrought iron; *Armstrong* 205. Some guns into which thin linings had been introduced, were found after proof to have had these linings moved; *ib.* 208-210.

Witness gives information as to the method pursued in the gun factories in lining the Armstrong guns, and explains the difficulty in performing the operation; *Anderson* 2368.

LOADING. *See* DRILL.

LUBRICATION. *See* FOULING.

#### M.

#### MACHINERY:

Witness states that the proper machinery for the manufacture of the Whitworth projectiles was not in the Royal Laboratory. Would not require so much as for the Armstrong projectiles, and in making an estimate he assumes the proper machinery is used, and allows for its cost, the interest of capital and repairs; *Bower* 1673-1675. Statements contradictory of the above; *Whitworth* 4017-4020. A great deal of difficulty is got over in the manufacture of the Armstrong gun by machinery; *Anderson* 2533. The complication of machinery required for the repair of the wedge gun; *ib.* 2977-2985. The first cost of experimental guns and stores is necessarily higher than the expenditure required to supply them in large quantities, from the fact that new guns require the adoption of special machinery, the expense of which can be spread over the estimate for a large contract; *Noble* 3687-3689; *Whitworth* 4000-4006. Time the best criterion of cost when working with machinery; *Whitworth* 4006, 4007. Opinion of witness that in the event of a sudden demand for guns, that the marine establishments could be made available for their manufacture, as their present machinery could be used, and would only require some small additions; *ib.* 4109, 4110. Statement that turning is the cheapest method of surfacing, and is the only nature of machinery at which there is no waste of tools; *Noble* 3627.

#### MERCER, CAPTAIN, late R.A.

Witness mentions report of Captain Mercer on the subject of the performance of the Armstrong guns in New Zealand, and differs in opinion with Captain Mercer on the results attained; *Seymour* 1993. 2003. 2010. 2012.

#### METAL, MUNTZ'S AND AUSTRIAN.

The mechanical properties of the Austrian or sterra metal, are very high, and it is much like the Muntz's in its composition, being composed of 60 parts copper, 40 of zinc, 4 of iron, and 2 of tin, that of the Muntz being 60 of copper and 40 of zinc. A gun made of the Muntz metal was found to become unserviceable from the melting out of the zinc from the heat caused by continued firing. Mention of the property of the sterra metal to increase in tenacity when cast and suddenly cooled, its strength going up to 25 tons thereby; *Anderson* 2339-2346.

#### MILMAN, GEORGE ALDERSON, MAJOR R.A. (*Analysis of evidence.*)

Is Captain Instructor at the School of Gunnery; 723. Rifle guns now in use give range enough for service; 726. A fire could be made very effective from this gun on a front of 50 yards from a distance of 3,000 yards; 728. Mr. Whitworth's gun has the advantage in range; its accuracy great; 735. The initial velocity of 12-pr. Armstrong, 1,242 feet; 70-pr. Whitworth, 1,184 feet per second; 745. In retardation much depends on the shaped head of the projectile; 753. A competent gunner would hit a six-foot target at 1,000 yards 14 or 15 times out of 20 shots with the Armstrong gun; 757. Does not think that greater accuracy or certainty could be desired with the Armstrong gun, as also the Whitworth; 763. 12-pr. easy to work; a detachment could be taught

the drill in five days, except the No. 1; 782. Likes the 20 and 40-pr. Armstrong very much, but not the 110-pr. Takes the latter too long to load when elevated, and the vent-piece is too heavy; 792. Wedge system admits of easier working; 796. The vent-pieces cause the 110-pr. to work heavier than 68-pr.; 808. No difficulty in working the shunt guns; 811. With 12-pr. five rounds take an average of three minutes 40 or 50 seconds to fire; 819. Tin cups cause the vent-pieces of 110-pr. to jam sometimes; 828. One kind of projectile for field guns advantageous, from its simplicity, and is equal to all requirements, as compared with 9-pr. smooth-bore for round shot and shrapnel only; 832. Some arrangement necessary for firing case; 836. Proposes short 20-pr. for batteries as a shell gun; 843. Recommends time and concussion fuze in each shell; 846. All natures of Armstrong projectiles satisfactory for the purpose for which they are intended; 856. Molten iron can be fired from 110-pr., but is of no value; 859. Knew one 12-pr. Armstrong to have fired 3,000 rounds, and is still serviceable. After 250 rounds the vent-piece requires refacing; 865. Copper ring should be removed after 800 or 1,000 rounds; 873. Refacing no practical disadvantage; 874. Should prefer muzzle-loader to breech-loader as a system, if the former were equal in the advantages of the latter; 879. Field carriages too weak on upper part of trail; 887. Has known the 110-pr. vent-piece jam; 909. Thinks vent-piece of heavy 110-pr. too weak; 912. The complication of breech-loading no drawback on service, but is more liable to damage from enemies' fire; 917. Has a favourable opinion of present pattern time and concussion fuzes; 919. The action of pillar fuze good; 929. It would be advantageous to have all fuzes with the same thread of screw; 934. Is of opinion that the effects from stripping are not so bad as those caused by wood bottoms of smooth-bore projectiles; 936.

#### MILWARD, THOMAS, MAJOR R.A. (*Analysis of evidence.*)

Commanded a battery of Armstrong 12-pr. 6 cwt. field guns in China in 1860. These guns were special; 1309. The range was very good, and shell acted well with concussion fuses, the time fuzes were bad, having been injured on voyage out from damp; 1316. Effect of shell at 450 yards was greater than from common smooth-bore case shot; 1317. You can pick up your range with concussion fuze; it will be seen when the shell bursts; 1319. Our shells produced great effect at 2,000 yards; 1320. We felt much the want of a common shell with large bursting charge; 1322. Recommends shortened 20-pr. Armstrong as a shell gun; 1325. Would have them in distinct batteries to simplify ammunition; 1328. Considers Armstrong gun sufficiently accurate; 1331. Our fire at 600 yards had the effect of obliging the enemy to desert their guns; 1335. At one place a whole gun detachment were killed with our segment shell. Our fire was direct; 1338. Found no difficulty in working our guns, sponged out after every 10 rounds; we had no lubricators; 1345. Our shells were not injured in transport, although they had much knocking about on board ship; 1351. Considers the effect of bursting a segment shell just in front of an embrasure would disable the gun detachment; 1354. Found the traversing arrangement useful when the wheels stuck in soft ground; 1358. Had but one accident with a vent-piece from not being screwed up; 1359. Found great advantage in having only one kind of projectile; 1364. My guns had some very rough work. Everything was covered with mud; they were soon cleaned, and as effective as before; 1365. Has found no inconvenience from breech-loading system; it requires more training and steadiness in the men; thinks the muzzle-loading simpler, and would prefer it, if the advantages of the Armstrong gun could be retained; 1379. Does not believe there was a man killed in front of his battery, while firing over the heads of the troops, by stripping the shells; 1383. Found only one shell burst in the bore, caused by a defective fuze; it did no injury to the gun; 1387. Nothing happened to us that we could not have repaired ourselves without a civil artificer; 1391. We faced our vent-pieces after 200 rounds; 1392. Would prefer a larger calibre and a shorter gun than 12-pr. if it did not increase its weight; 1395.

#### MOLTEN IRON.

Evidence given that molten iron may be used in Armstrong shells, but that the general effect is not

very great, and they do not seem to be of any practical value; *Alderson* 678; *Milman* 859; *Taylor* 1563; *Gardner* 2608.

MOORSOM FUZE. See FUZE.

#### MUZZLE-LOADERS.

Evidence in favour of muzzle-loading for ordnance generally; *Whitworth* 53; *Bechervaise* 1217; *Rice* 1927; *Seymour* 2015, 2031. Witnesses state that muzzle-loaders would be best adapted for field service; *Alderson* 584; *Milman* 879; *Milward* 1379; *Desborough* 1463; *Glyn* 1955; *Gardner* 2611, 2612. Statements made of preference felt in the use of muzzle-loading for heavy guns; *Cox, J.* 471. 473; *Alderson* 690; *Gardner* 2611, 2612. Witnesses believe that muzzle-loaders will be required for the penetration of iron plates, as giving more promise of strength than breech-loaders to stand the action of large charges; *Harrison, A.* 1435; *Hay* 1841; *Hewlett* 2092. 2187. Evidence given that the muzzle-loader would afford means of more rapid firing than the breech-loader; *Cox, S.* 292. 383; *Cox, J.* 480. 526; *Powell* 2285; *Gardner* 2606. Witness states that, owing to the confined space in cupolas, that there would not be room to load a muzzle-loader; *Powell* 2246. Evidence states that it is a matter of choice for the service to determine whether there should be muzzle or breech-loaders, as either can be produced as far as mechanical questions are considered; *Armstrong* 147; *Anderson* 3066. Evidence of the efficiency of the Armstrong muzzle-loading shunt gun, as to accuracy, range, and ease of working; *Cox, J.* 568; *Alderson* 647; *Milman* 810-814; *Hay* 1848. Witness mentions the mechanical difficulties in rifling the shunt gun; complains of its want of simplicity, and considers the shunt arrangement could be done without; *Anderson* 3162-3167. 3204. Statement of the number of grooves in the shunt guns to be six for the 150-pr., eight for 300-pr., and ten for 600-pr.; *Noble* 3663.

#### N.

#### NEW ZEALAND.

Evidence of the results obtained in the use of the Armstrong guns in New Zealand; *Glyn* 1944-1990; *Seymour* 1991-2046.

#### NINE-POUNDER ARMSTRONG GUN.

Witness proposes the 9-pr. Armstrong gun for the Horse Artillery; *Armstrong* 119. Weight, calibre, length, &c. of 9-pr. Armstrong guns; *App.* 160. Particulars of the manufacture of the 9-pr. Armstrong gun; *Anderson* 2406. 2447-2452. Evidence of the manner in which the 9-pr. gun stood hard usage; *Alderson* 698; *Taylor* 1491.

#### NOBLE, ANDREW, CAPTAIN. (*Analysis of evidence.*)

The witness states that the construction of the different 12-pr. guns is similar. They have steel barrels, which are supplied solid by the trade, and no patent right has ever been paid on them, either by the steel makers or the Armstrong firm; 3225-3230. The barrels are bored and tested in various places, pieces are cut off for the proof of the metal before the barrel is bored. The liability of steel to contain flaws is excessive, and requires the greatest care, none of the barrels made by the best makers are perfect; 3231-3235. The quality of the steel is improving, but still the flaws continue; Mr. Whitworth has the same defects to complain of. There are a large per-centage of the barrels bad. With the 12-prs. there is comparatively little difficulty; but with the 150-prs. we return now as much as 30 per cent. to the makers. There are greater chances of failures in large masses of steel than in small ones. The number of rejections in the 12-pr. is not more than 10 per cent.; 3236-3246. Having written to the steel makers, they stated they did not pay any patent right. The ingots are cast with a dead head, and when received from them they are drawn out, discs cut off from each end, from which rectangular bars are formed, and subjected to proof for toughness, by bending to a certain angle. The bottom of the ingot while casting is the best part, and is placed in the breech of the gun. The barrel is bored and examined for flaws. The steel is of a very mild quality, converted from Swedish iron and run into ingots; it is of a different quality from tool steel, and its cost varies according to size from 70*l.* to 120*l.* per ton; 3247-3268. From the earliest manu-

facture of the Armstrong gun steel has been tried for barrels, and the great trouble given by them at first caused their being abandoned. The use of steel for large guns was commenced in 1862, with the 70-prs. towards the end of 1862, and the 12-prs. at the commencement of 1862. The guns in the service as yet from Elswick are all "coiled" with a few exceptions; 3272-3281. No inferior steel has been used at Elswick for guns. Thinks the Bessemer steel could be used up to the 70-prs., for which size and the 12-pr. the ingots would cost from 50*l.* to 60*l.* per ton, it is thus high, as it would probably be the Bessemer steel remelted. Steel may be expected to cheapen, but has considerable doubts of its being the best material for gun making. Places dependence for strength upon the hoops outside the steel barrel. For a 12-pr. a gun might be made of steel alone; 3286-3302. The fair average cost of the steel for 12-prs. is 70*l.* per ton, and the cost of the finished barrel would be about 140*l.* per ton, exclusive of labour. Considers that the use of the steel barrel for the 70-pr. should be fully recognised, not as regards strength, but for freedom from flaws. Sir W. Armstrong prefers the steel barrel to the coiled one; 3303-3324. The inability of steel to stand percussive action as well as wrought iron, has led to the belief that it will not succeed ultimately as a gun metal. Considers there is no advantage in substituting steel for wrought iron. It is when large masses of wrought iron are welded that uncertainty prevails. And in making a cylinder, the only uncertainty which exists is in the welds; 3329-3348. The solid forged barrels made at Woolwich were an utter failure, from their liability to have longitudinal flaws; their manufacture is now abandoned. The welds have only 50 to 60 per cent. of the strength of the original bar from which the cylinder is made. The comparative tensile strength is obtained by small bars cut out and broken by tension. Steel is acted upon slightly more than wrought iron by the action of the powder. But where there are defective welds in wrought iron the powder will eat in more; 3349-3370. The mild steel will weld, but not well. The 12-pr. barrels have been tempered in oil after they are bored and turned. The large barrels are inconvenient to temper, and the effect on them would be questionable. The method of tempering the barrels in oil is determined by the practical knowledge of the workman of the material. The evils of tempering in large masses are greater than the advantages to be gained. In tempering barrels they may get crooked, and it denotes a want of homogeneity; 3372-3400. There is great additional expense in preparing steel as compared with wrought iron. The cost of the Armstrong guns with steel barrels depends upon what is put upon them for depreciation, whether you include simply workmanship, or the value of machinery and depreciation of plant. The cost of the barrel would be about 50 per cent. above the cost of the ingot as delivered, or taking it first as costing 35*l.*, when finished, would amount to 52*l.* Large guns are being made at Woolwich in exactly the same way with steel barrels. It is hardly necessary to go into details to ascertain the relative cost of the Armstrong and Whitworth guns, as the former are made of much cheaper material, they must cost less, both kinds being built up; 3401-3427. The price of the shunt and breech-loader comes to the same, the latter being lighter. The price of 12-pr. given in former list was 90*l.*; for the breech-loader, as delivered to the Committee, 254*l.*, and 226*l.* for the shunt, not one-third of these sums should be taken as a fair average price. Mr. Whitworth asks, 3,000*l.* for a 300-pr.; the Armstrong price is 1,620*l.*, and it stands to reason that if a material costing 80*l.* in the rough is used for guns, that they must be more expensive than if made of metal costing 20*l.*; 3428-3447. The coiling and welding the wrought iron increases the prices of material to 30*l.* per ton. In the gun factories an iron is being used for coils costing from 12*l.* to 14*l.* a ton, and if it is found to answer it will reduce the cost of coil guns to a great extent. The iron used in the Armstrong guns is of the very best description. All experience goes against steel being better than iron for guns. Four of the Whitworth guns supplied to the Egyptian Government failed, and also some made for the Danish Government. There has been no lives lost by the Armstrong guns bursting, while several have been sacrificed by the instances mentioned of the Whitworth. The gun factories are making efforts to retain the coiled barrels from the uncertainty of steel; it is uncertain whether

steel or wrought iron barrels will ultimately prove the best; 3448-3479. Sir W. Armstrong objects to steel for ordnance, from its not standing a sudden blow; it is notorious among those who have used iron, that tensile strength is no test of fitness to stand percussive strain. The action of gunpowder within a gun may be compared with the action of the projectile striking a plate, both being a sudden and percussive force. Considers that inferior wrought iron would be better than steel for the outsides of guns and if inferior iron was used it might be made up in strength by more weight; 3483-3509. Steel in the barrels is not depended on, but is strengthened with wrought iron coils, the outside taking the strain as well as the inside. One and all are giving up the use of steel in the solid form for guns. Cast-iron guns burst equally, whether there are hoops on them or not; they have none of the properties of built-up guns. A matter of importance to have the element of strength preserved on the outside of the gun, and if steel could be made so it would be adopted. The value of a gun might be determined by its endurance; 3510-3535. When the barrel is prepared, the coils are shrunk on. There is a certain amount of contraction allowed for, the object being to get a tensile strain upon the coils. The temperature to which they are brought is a dull red heat, about 1,000° to 1,200° Fahrenheit. There is a constant stream of water flowing inside to keep the gun cool; 3544-3558. Considers that the method of putting on coils by hydraulic pressure is not superior to shrinking them on; refers to General Gilmore's report of the Whitworth guns spiking themselves. There is no difficulty in turning and shrinking on the cylinders, either parallel or with a taper. On the 12-pr. there are four coils over the barrel, placed on one after the other. The breech screw in the 12-pr. muzzle-loading Armstrong is of steel, and in the 70-pr. of iron. The breech-piece is forged so as to have its strength running longitudinally. The guns in the arsenal are welded exactly the same way. The breech-screw can be taken out after the gun has been fired. The cost of a 70-pr. steel barrel finished will be 210*l.* per ton; 3562-3594. Sir Wm. Armstrong's opinion is, that the cost of the guns vary as the material, and if Mr. Whitworth will make a bonâ fide statement of what he is making his guns for, Sir Wm. Armstrong is prepared to do the same, referring the Committee to foreign ambassadors for the prices at which guns have been supplied to their governments; 3595-3604. Any system of rifling makes very little difference in the cost of guns. Considers that the workmanship of the Whitworth cannot be done cheaper than the Armstrong gun. The breech-loading 12-pr. Armstrong was intended to fire shell, and it was never meant to fire shot. Breech-loading apparatus is of itself more expensive than muzzle-loading, if guns of equal dimensions are compared. The limit of the weight of a gun to that of the shot depends on the size of the former, and the compression which can be given to the gun carriage in recoiling; in the 9-pr. and 6-prs. the proportion is as low as 90 to 1; 3607-3625. With regard to cost of projectiles, if they were ordered in large quantities, they could be supplied at 25 to 30 per cent. below what they cost the Committee. Considers turning the cheapest mode of surfacing projectiles. Prefers undercutting to placing the lead on by the zinc process, and believes it cheaper, although the Royal Laboratory experience is the reverse. Undercut projectiles when carried in limbers have the lead on the shot sometimes shaken loose, but on the whole they bear travelling as well as the old smooth-bore projectiles; the shunt are, however, better in this respect; 3626-3647. The cost of tools to accompany the breech-loader add about 2 per cent. to the cost of the gun, but would be inappreciable for a battery, as one set is sufficient for six guns. There is very little difference in the cost of the breech-loading and shunt projectiles, and it is slightly in favour of the latter. Recommends the holes for the studs of the shunt being bored instead of cast. The number of grooves for the shunt guns is six for the 150-pr., eight for 300-pr., and ten for 600-pr. The number of studs is determined by the pressure which drives the projectile; 3648-3665. Mentions that a number of 12-pr. segment shell have been supplied at 2*s.* 10*d.* each; 3648-3675. The cost of fuzes would be, for time fuze, 2*s.* 6*d.*, concussion, 1*s.*, and the pillar fuze, 1*s.* 10*d.* We offered the time fuze at 2*s.* The fuze adapter, 6*d.* It was shown to the Committee on Ordnance that the Armstrong projectiles were supplied at a lower price per ton than the rate at which

the diaphragm shrapnel shell were manufactured for Government. The price of the 110-pr. common shell at first was 23*s.* 6*d.* each, which was reduced to 13*s.*; 3676-3689. The barrel of the 600-pr. Armstrong was cast as a tube, and drawn out on a mandril. The ingot for a 300-pr. wound cost 300*l.*, or about 100*l.* per ton; the relative cost of the wrought iron would be 55*l.* 24 tons of material required to make a 12-ton gun. A 600-pr. barrel is worth 600*l.* before anything is done to it, and 150-pr. is worth 180*l.* Krupp is the most expensive steel maker. The expense of tool steel is about 70*l.* per ton. Special instruments have been constructed for rebushing the side-loading breech-loaders; 3676-3719.

#### NUMBER :

Witness explains the method of giving credit by numbers for practice carried on in the "Excellent;" Liddell 1183. Evidence gives 2900 as the number of Armstrong guns that have been received into store at Woolwich; Gordon 1750. Statement of the number of Armstrong shells requiring releading in the Arsenal to be 100,000, and the number of new fuzes making in the laboratory is 50,000; Boxer 1677, 1723. The number of Armstrong guns mounted at Gibraltar 50, at Malta 40, and at Portsmouth 40; Gordon 1749. Evidence showing the number of rounds fired in June quarter 1862 at Shoeburyness; Taylor 1552. Evidence of the immense number of Armstrong projectiles prepared with the tin process, all over the world on land and sea; Gordon 1792. Witness states the number of Armstrong guns made at the gun factories Woolwich; Anderson 2350, 2351, 2356, 2359. Return showing the number of guns made in the gun factories and Elswick up to March 1863; App. 164. Return of the number of the Armstrong guns issued; App. 167.

#### O.

##### ONE HUNDRED AND TEN-POUNDER ARMSTRONG GUN.

Witness states that the 110-pr. cannot be fired quite so fast as the 68-pr. smooth bore; Cox, S. 333. The 110-pr. is on the whole a heavier gun to work than the 68-pr.; Alderson 648, 649; Milman 804; Rice 1911. The 110-pr. is complicated, and when firing at high angles, the gun requires to be depressed before loading; Milman 788, 790. Evidence of the vent-piece jamming in the 110-pr.; Milman 902-913; Liddell 1035; Bechervaise 1209. Statement in favour of the employment of the 110-pr. as a pivot gun; Liddell 972. 1037; Bechervaise 1209; Rice 1939, 1942. Witness states the 110-pr. is better adapted for cupolas than any gun he knows of; Liddell 1092. Evidence in favour of the 110-pr. as a broadside gun, more particularly from the result which may be obtained by firing from it a projectile of 68 lbs. in weight with the service charge of powder; Hay 1840.

##### ORDNANCE SELECT COMMITTEE :

Witness gives evidence of 1450 as the number of rounds fired at Shoeburyness for the Ordnance Select Committee for the quarter ending 30th June 1862; Taylor 1552. Evidence states that the Ordnance Select Committee made a number of experiments to determine the initial velocity of the Whitworth gun; Boxer 1665. Statement of some wedge guns being issued to the Ordnance Select Committee; Gordon 1761. Witness states that it rests between the Ordnance Select Committee and the Inspector of Artillery whether it matters if the lead-coating of Armstrong projectiles be loose or not; ib. 1789. Evidence of the breech-loading system for ordnance proposed by Mr. Westley Richards being under the consideration of the Ordnance Select Committee; Hay 1835. Witness states that he suggested to the Ordnance Select Committee, the necessity of coating the gas pipe bursters for Armstrong shell with a preparation to protect them from rust; Bent 2757. Letter from Ordnance Select Committee, forwarding a return of the experiments, made to ascertain the penetration of the Armstrong and Whitworth guns; App. 157, 158.

##### PATTERNS, CHANGES OF. See ALTERATIONS.

## PENETRATION:

Evidence of the necessity of employing larger guns than hitherto used in the service, for the penetration of iron-plated ships; *Armstrong* 164; *Alderson* 662; *Harrison*, A. 1414; *Letters of Sir W. Armstrong*, App. 156-203. Statement that in the experiments for the penetration of iron plates, that the Whitworth gun has been most successful; *Cox*, J. 529-533; *Alderson* 664; *Taylor* 1508; *Hay* 1856; *Hewlett* 2188; *Whitworth* 4008-4016. Witness gives a detail of various experiments carried on for the purpose of determining the best method of penetrating iron plates; *Harrison*, A. 1401-1444 (*see Analysis of his evidence*). The successful penetration of iron plates depends on the material of the projectile, and the velocity with which it is delivered against the plate; *Harrison*, A. 1414; *Taylor* 1511; *Hay* 1832. 1858; *Gardner* 2724. Statements that muzzle-loading guns give the best promise of success in the penetration of iron plates from their being best adapted to stand heavy charges, and thus give high velocity; *Harrison*, A. 1435; *Hay* 1841; *Hewlett* 2092. 2187. Evidence that flat-headed projectiles do not give greater penetration of iron plates unless the latter be inclined; *Harrison*, A. 1437; *Boyer* 1735; *Hay* 1859-1862. Detail of experiments, for the determination of penetration of projectiles in water; *Liddell* 1075-1087. Further evidence of submarine penetration and example given of the very destructive effect of a shell fired through the bottom of H.M.S. "Griper," and opinion given of the practicability of carrying on submarine warfare; *Hewlett* 2165-2181. Opinion that the 110-pr. Armstrong is unsuited for the purpose of penetrating iron plates; *Gardner* 2614. Evidence of the penetration of masonry, earthworks, and wood by the Armstrong and Whitworth guns; *Alderson* 667-672; *Taylor* 1547-1550; *Harrison*, R. 1893. 1894; App. 158. Witness states that at experiments that he saw of firing against the cupola shield that the penetration of the 68-pr. and 110-pr. Armstrong were nearly alike; *Liddell* 976. Evidence cannot determine why the rapidity of twist should give increased penetration as contended by Mr. Whitworth, and states that it might give a slight push in passing through; *Boyer* 1690. Witness gives his views relative to the best means of penetrating the sides of ships; *Whitworth* 3969-3978.

## PER-CENTAGE:

Per-centage of mechanical failure, at the Royal gun factories Woolwich in the manufacture of the Armstrong guns; *Anderson* 2967. The per-centage of steel barrels found unfit for the Armstrong gun very large; *Noble* 3237-3246. Denial that Sir Wm. Armstrong pays any per-centage or royalty for making use of the steel barrels for his guns; *ib.* 3228. 3247-3249. The value of the steel barrel for the Armstrong guns, is about 50 per cent. in addition to the original steel ingot, turning and boring being included; *ib.* 3309, 3310. 3411-3413. Opinion that the welds in wrought iron have only 50 or 60 per cent. of the strength of the iron in bar; *ib.* 3356. 3364. Statement that the projectiles supplied to the Committee would be 25 to 30 per cent. cheaper if supplied in large quantities; *ib.* 3626. The expense of tools for repairing an Armstrong gun would not add more than 2 per cent. to the expense of it; *ib.* 3648. Evidence of the payment of 2 per cent. to Mr. Whitworth from Messrs. Firth steel makers for using his patent right; *Whitworth* 3733-3747.

PERCUSSION AND PILLAR FUZE. *See* FUZE.

PINS, KEEP. *See* LEVER.

## PIVOT GUNS.

Witnesses state the advantage of the Armstrong gun for use as pivots, on board ship, from their accuracy and great range; *Liddell* 972. 1037; *Rice* 1939. 1942. Evidence that the only disadvantage of the 110-pr. as a pivot lies in the difficulties of loading it; *Liddell* 1037; *Bechervaise* 1209. Witness would prefer a Whitworth gun as a pivot; *Seymour* 2028. Opinion that the weight of a pivot gun should not be more than 5 tons, unless entirely controlled by machinery; *Hewlett* 2083-2085.

POLYGONAL. *See* RIFLING.

## POWDER:

Evidence that Captain Brown's plan of solidifying powder is so satisfactory as to permit of flannel cartridges being dispensed with; *Whitworth* 54.

Witness states that in small guns the size of the grain of powder does not make much difference, but in large guns it is desirable to use powder of a large grain; states also that 2A<sup>4</sup> powder is much more rapid in its action; *Armstrong* 176-179. Statement that when gunpowder is in contact with metal that there is a great deterioration of both, and this disadvantage exists in the Armstrong fuze; *Boyer* 1714-1720. Witness mentions the injury done to the powder in the gas pipe bursters for Armstrong shell; *Bent* 2757. Evidence that with 10 lbs. of the Armstrong powder the Whitworth gun attained a proportionately longer range than with 12 lbs. of the ordinary cannon powder; *Whitworth* 3838-3852. Witness prefers the strongest powder to be used in his gun for the penetration of iron plates, and in consequence applied for the smooth bore powder; *ib.* 4039-4053.

POWELL, RICHARD ASHMORE, CAPTAIN R.N. (*Analysis of evidence*.)

Commanded a vessel with six Armstrong 110-prs. on board; 2225. Only exercised with them twice, and was satisfied with them, with the exception of the vent-pieces breaking twice, and the want of facility in training; 2228. No inconvenience from smoke between decks; 2237. The vent-pieces that broke had not the projection behind; 2239. Considers the Armstrong breech-loader a good gun for a cupola; 2246. In practising in, and firing against the cupola, lost confidence in the Armstrong gun from the breaking of the vent-pieces; 2252. Considers this gun inconvenient, and more liable to injury than a common gun; 2254. As a boat gun, considers the Armstrong gun violent in recoil, and a little more inconvenient than the ordinary gun; 2260. With every appliance to work a broadside gun, sees no objection to a weight of 10 tons; 2266. Could not go beyond the 110-pr. Armstrong as a breech-loader, on account of the vent-piece; 2268. Considered the accuracy of this gun very satisfactory; 2269. It did not cause much loss of time to raise the breech in loading; 2273. Does not consider the recoil of the 110-pr. excessive; 2276. In selecting guns for a ship, would have the majority of smooth-bore and muzzle-loaders, and the minority Armstrong breech-loaders; 2282. Thinks a breech-loader less fatiguing to work, but not so rapid to fire as a muzzle-loader; 2285. No difficulty in handling the vent-piece of 110-pr.; 2289. Have had inconvenience from the tin cup jamming the vent-piece; 2294. A vent-piece stuck in, and we could not get it out; 2305. Does not think the Armstrong projectile good for ricochet firing; 2307. Has found the Armstrong fuzes successful; 2309. Considers the mode of altering the Armstrong fuze an advantage; 2312. Has known no instance where the shot became unserviceable from dents on it; 2314. Considers cupolas, for training and accuracy, are unequalled; 2320.

PRECISION. *See* ACCURACY.

PRICE OR COST. *See* EXPENSE.

## PROGRAMME:

The programme of the Armstrong and Whitworth Committee for the competitive trial of the contending field guns:—For range, initial velocity, and retardation, accuracy, penetration, destructive effects, ease of working, recoil, rapid and prolonged firing, capability of standing rough usage; App. 165, 166.

Sir W. Armstrong's programme, with zinc and undercut projectiles, fuzes, and rapid firing; App. 285-288.

Mr. Whitworth's programme, with rifled spheres, shot and submarine practice; App. 328-331.

## PROJECTILES:

- 1st. Armstrong projectiles.
  - 2nd. Whitworth projectiles.
  - 3rd. Projectiles of other natures.
- 1st. Armstrong projectiles.

Evidence in approval of the Armstrong projectiles; *Cox*, S. 236; *Milman* 856; *Liddell* 1096. 1134; *Milward* 1314; *Taylor* 1537; *Gardner* 2652. Statement of the formidable nature and very destructive effects of the Armstrong shell; *Cox*, S. 295. 355; *Alderson* 711; *Milward* 1353, 1354; *Harrison*, R. 1865, 1866. 1877; *Hewlett* 2174; *Gardner* 2651. Opinions given of the great advantage of having but one form of projectile in the field; *Cox*, S. 257; *Milman* 832; *Liddell* 1133; *Milward* 1364; *Glyn* 1975; *Gardner* 2721. Evidence that the Armstrong projectiles are not easily damaged,

and that in the event of any dents being found upon them they are easily removed; *Cox*, S. 308. 317; *Cox*, J. 552-557; *Alderson* 637, 638; *Liddell* 1098; *Bechervaise* 1286, 1287; *Milward* 1349-1351; *Rice* 1916, 1917; *Powell* 2314. Witnesses state the liability of the old pattern Armstrong shell stripping on being fired; *Cox*, S. 355-361; *Alderson* 582; *Milman* 936; *Taylor* 1566, 1567; *Gordon* 1788; *Glyn* 1972, 1973; *Seymour* 1993; *Hewlett* 2204. Evidence that since the zinc process of attaching the lead has been introduced, that the stripping has been obviated; *Cox*, S. 361; *Alderson* 582; *Taylor* 1566; *Boxer* 1684. 1687. 1739; *Gordon* 1791; *Hewlett* 2204, 2205. The method of attaching the lead coating by means of the tin process was defective, and caused stripping and separation of the metals; *Cox*, S. 408-410; *Boxer* 1680. 1682-1687; *Gordon* 1783-1788. 1792; *Glyn* 1990; *Hewlett* 2204; *Bent* 2758. The stripping of the Armstrong projectiles is of no practical disadvantage; *Milman* 936-939; *Milward* 1383-1385; *Taylor* 1566-1568. Witness observes that the heavier projectiles are most liable to injury, from the liability of their being dropped while being carried; *Cox*, S. 372. Opinion given the projectile for the 110-pr is not satisfactory, not being adapted for firing at iron plates; *Liddell* 1096. Witness mentions the small per-centage of Armstrong projectiles injured by travelling in a field battery subject to examination, and states that the largest proportion injured was six out of 123, all of which by a little hammering were made to fit the bore; *Taylor* 1542. Statement that the shells manufactured with the tin process are to be considered unserviceable, and to be withdrawn accordingly. There are, however, a large number of this nature all over the world by land and sea; *Gordon* 1782, 1783. 1792. Evidence that in some instances, from jolting in the limber boxes, that the bases of the Armstrong shell become enlarged, and that on the change of ammunition of two batteries, that out of 1,486 shells 394 were unserviceable; *Gordon* 1819-1823. Statements that the mode of attaching lead by the undercutting process has proved a failure; *Boxer* 1682; *Bent* 2758. Witness relates the principles which regulate the manufacture of the projectile for the Armstrong shunt gun, and mentions the number of fragments into which 12-pr. Armstrong shell breaks, together with its price complete with fuze; *Armstrong* 147-155. 180-189. Evidence of the advantage of a soft metal coating to rifle projectiles; *Armstrong* 147; *Alderson* 618; *Taylor* 1505; *Hay* 1836. 1838; *Hewlett* 2076. Cost of re-leading Armstrong projectiles by the zinc process about 10l. per 100; *Boxer* 1740. Witness states that the fuze holes of shells made at Elswick were found to have their fuze holes out of the proper centre line of the shell; *Boxer* 1677. Evidence that the inspection of projectiles made at Elswick rests with the Inspector of Artillery, while those made at the Royal Laboratory are inspected in that department; *Boxer* 1679, 1680; *Gordon* 1781. Comparison of the action of a projectile striking an iron plate with that of the explosion of the charge on the gun, both being subject to a strain suddenly applied; *Noble* 3496-3500. Evidence that shot was only supplied for the trial of the 12-pr. Armstrong in consequence of the demand of the Committee, as shell is the projectile best adapted to the gun on service; *ib.* 3614. 3615. The question of the weight of gun to that of the projectile is rather an involved one, as the recoil of the gun carriage has to be considered. In the 9 and 6-pr. Armstrong it is as low as 90 to 1; *ib.* 3622-3625. The cost of the projectiles supplied for the competitive trial are 25 to 30 per cent. higher in price than if the same projectiles were supplied in large quantities to Government; *ib.* 3626. The method of turning the shunt projectile the cheapest form of surfacing; opinion that the Whitworth projectile must first have the corners turned true, and it must then be shaped; *ib.* 3627. The witness is inclined to recommend the lead being attached to the Armstrong projectiles by undercutting, instead of zincing; states that although the latter process may have been found cheaper in the Royal Laboratory, it has not been so at Elswick. Knows no objection to the undercut process, except that projectiles have the lead on the nose of shell sometimes loosened from shaking in the gun limbers; *ib.* 3628-3647. Evidence of the method of putting on the studs on the shunt projectiles, the rule for the number inserted being determined by the pressure required to drive the projectile; *ib.* 3653-3665. Opinion that the shunt projectile is cheaper than the Whitworth. Statement of prices at which the Armstrong projectiles have

been supplied; *ib.* 3670-3675. 3689. Table of weight, material, dimensions, and cost of Armstrong projectiles; *App.* 159, 160. Experiments for penetration of Armstrong and Whitworth projectiles; *App.* 158. (See further competitive experiments.)

## 2nd. The Whitworth projectiles.

Evidence mentions the necessity of two natures of projectiles for the Whitworth gun; *Milman* 849. Statement of objection to Whitworth projectiles, from the shot and shell being of different lengths, thereby causing an irregularity in the ranges; *Taylor* 1535. Witness states, with regard to the Whitworth shrapnel shell, that a very good form has been given to them, by which only a small amount of deflection is caused and a greater range attained than by the form adopted for the Armstrong gun, and considers the results obtained by the Whitworth very satisfactory. Is of opinion that to secure proper bursting of this shrapnel, that two bursting charges should be available to be used according to range, and thus secure a proper spread of the bullets. Believes the Whitworth more effective than the Armstrong segment shell. Observes that the Whitworth shot would be shorter than the shell, and is of opinion that shot of different lengths may be fired from the same gun if sufficient twist be given, and mentions that the cost of the Whitworth shell is less than the Armstrong. Recommends the use of the Whitworth shrapnel as shot, shell, or case shot, it not being safe to fire the ordinary case from a Whitworth gun; *Boxer* 1570-1576. 1590-1600. 1602-1606. 1667. 1691-1693. 1732. In connexion with the above, see the correspondence of Sir Wm. Armstrong, Mr. Whitworth, and Colonel Boxer, *App.* 204. 207. Evidence that the friction of the hard surface of the projectile in the Whitworth gun is detrimental to the lasting properties of the gun; *Hay* 1836. 1838. 1848, 1849; *Hewlett* 2050. 2076. 2093. 2190. Opinion that the friction of hard surfaces is no injury to the bore, and that the Whitworth projectile is therefore preferable from not requiring lead coating, which is so liable to deteriorate; *Anderson* 2472-2476. 3002. 3142-3144. Witness mentions the necessity of using a sabot to prevent the Whitworth shot slipping forward in the gun; *Hay* 1850. Witnesses state that the shell arrangement of the Whitworth gun is not good, and not to be compared to the Armstrong in its present state; *Cox*, J. 559; *Taylor* 1537; *Isacke* 2853; *Best* 2895-2903. Evidence gives the rule for determining the size of the Whitworth projectile, and states that a gun of proportionately larger bore should be used for shell firing; *Whitworth* 27. 46-48. 76. 114. Statement of the principle recommended for the Whitworth projectiles would be relatively small diameters, and for the shell five diameters in length if sufficient rotation could be attained; *ib.* 3969-3974. Opinion that the cost of projectiles is of much greater importance than that of the gun, from the large consumption of the former in comparison with the number of guns worn out in the service; *ib.* 3810. 3994. 4065. 4096. The element of time the best means of comparing the cost of projectiles according to the two systems, the cost of the material can afterwards be added; *ib.* 3994-4005. Evidence of the first experiments with steel projectiles for penetration of iron plates, and the success attending Mr. Whitworth's shell fired against the "Trusty;" *ib.* 4008-4016. 4098-4100. Witness would undertake to supply the Whitworth projectiles in any quantity, simply cast without any tooling, but states it would be better to tool, which costs 5d. per dozen for the 12-pr. shot; *ib.* 4022-4026. For details of the weights, material, and dimensions of the Whitworth shells, &c.; *App.* 161. For the penetration of iron plates by Whitworth projectiles. (See PENETRATION.)

## 3rd. Projectiles of other natures.

Evidence that the general effect of molten iron in shells is not very great; *Alderson* 678; *Milman* 859; *Taylor* 1563. Opinion that the effect of grape and case at short ranges is better than the Armstrong segment shell; *Powell* 2043, 2044; *Hewlett* 2193. Evidence that the amount of retardation to a projectile depends very much upon the form of its head, and that the retardation of a rifle shot is much less than a smooth-bore; *Milman* 750-753.

FOR FLAT-HEADED PROJECTILES. See PENETRATION.

PROOF. See INSPECTION and PROOF.

## R.

## RANGE:

Evidence of the excellence of range attained by the Armstrong gun; *Cox*, S. 230; *Cox* J. 415; *Milman* 726-729. 737; *Liddell* 944; *Bechervaise* 1196, 1197; *Milward* 1311. 1330; *Rice* 1904; *Hewlett* 2049; *Gardner* 2602. Statements of the ranges obtained by the Whitworth guns, and mention made of their exceeding the Armstrong in accuracy and extent of range; *Cox*, J. 500. 521; *Alderson* 623. 706; *Milman* 735; *Seymour* 2029; *Hewlett* 2051. Witness mentions the range of Whitworth guns tried at Shorncliffe as differing very much from each other; *Best* 2901-2903. 2927-2930. 2938-2942. Evidence of the effect on range and deflection, obtained by the tapering form of shell adopted by Mr. Whitworth, giving with 10 degrees of elevation 500 yards more range than an Armstrong projectile under the same circumstances; *Boxer* 1570. Mention of the effective fire of the Armstrong gun in China at a long range; at 2,000 yards the effect on the enemy was most destructive; *Milward* 1320. Evidence of the ranges obtained at Shoeburyness and at Southport with the 70-pr. Whitworth, with the slow burning Armstrong powder, and with the ordinary smooth-bore powder; *Whitworth* 3838-3853. 4044-4050. Instances given of ranges with various Whitworth guns; *ib.* 1. 6-8. 13. 67. 74. Statement that the Whitworth 9-inch gun at 2,000 yards will send a shot through the side of any ship afloat; *Whitworth* 3969.

## RAPIDITY OF FIRE. See FIRE.

## RECOIL:

Witnesses state that recoil determines the weight of a gun; *Armstrong* 201; *Whitworth* 3837. The recoil of the 20-pr. Armstrong shortened gun is very great; *Cox*, S. 379-382. The short 20-pr. Armstrong gun, when mounted temporarily on a 32-pr. howitzer carriage, did not have an excessive recoil; *Alderson* 611. The 12-pr. Armstrong gun has a very sharp recoil; *ib.* 639. The recoil of the 40-pr. Armstrong is very little more than the 8-inch gun; *Liddell* 1159. Witness states his opinion that the recoil of large guns on board ship may be met thoroughly by the adoption of Captain Cowper Coles's system, there being only a limit to the number of guns carried; *Hay* 1854. The recoil of the 110-pr. Armstrong is sharper than the 68-pr. of 95 cwt., but still perfectly controllable; *Rice* 1934. Witness states the recoil of the 20-pr. Armstrong boat gun is violent, but still prefers it to the 24-pr. howitzer. The recoil of 110-pr. Armstrong is sharper than the corresponding smooth-bores, but it must be recollected that the weight of the gun is comparatively less, consequently the strain upon the breeching and bolts is less; *Hewlett* 2214. 2285. Evidence thinks the 12-pr. Armstrong is a little violent in its recoil; does not consider the recoil of 110-pr. intense, as compared with that of the smooth-bore of same calibre; *Powell* 2259. 2275. A certain weight is required in the gun as regards recoil, and by having recourse to mechanical means the recoil may be kept within bounds; *Anderson* 2424. 3153. Statement that the question of recoil enters into the weight which should be given to a gun, as compared with the weight of the projectiles; *Noble* 3622-3624.

## RE-LOADING PROJECTILES. See COATING.

## REPAIRS:

Witness states that the concussion fuzes of his battery were very much injured, but he repaired them with the aid of the civil artificers attached to the battery, and mentions that everything in the battery that wanted repair could have been done with the men of the battery; *Milward* 1390, 1391. 1399. Evidence states that tools for the repair of Armstrong guns are issued by him, which are extremely complicated; *Gordon* 1755-1758. Statement that the repair of the Armstrong guns necessitated the carrying of complicated tools, and required trained artificers; *Gardner* 2667. Mention made of the ease with which an Armstrong gun was repaired on board the "Excellent," in which four shells had burst and injured the rifling; *Hewlett* 2049-2051. The difficulties of repair much increased by the introduction of the wedge gun, which is not so easy to repair as the screw breech-loader; *Anderson* 2558-2573. Evidence that of three wedge guns tried at proof, two required repair afterwards; *Gordon* 1772. Statement of the number of Armstrong

guns issued, and afterwards returned to Woolwich for repair; *Gordon* 1748; *App.*, 167-200. All minor repairs are performed at the stations where the guns are situated; *Gordon* 1752. Detail of tools required for keeping in repair Armstrong guns; *Gordon* 1794; *Noble* 3648; *App.*, 162-164.

## RETARDATION:

It would appear reasonable to infer that when the initial velocities are nearly the same the greatest range would necessarily experience the least retardation. The retardation of a rifled shot is comparatively much less than a smooth-bore; and the difference of retardation depends very much on the shape of the head of the projectile; *Milman* 750-753. Experiments to ascertain the retardation of the projectiles fired from Armstrong and Whitworth competitive field guns; *App.* 368, 370, 371.

## RETURNS:

Tabular statement or return of each description of Whitworth gun with projectiles and full detail; *Whitworth* 112; *App.* 161. Return of all descriptions of Armstrong's guns manufactured; *App.* 159, 160. Return of facing implements supplied for each nature of Armstrong gun; *App.* 162. Return of special tools supplied for, and spare articles allowed for Armstrong guns; *Gordon* 1794; *App.* 163, 164. Return of the number of Armstrong guns manufactured at Woolwich and Elswick; *App.* 164, 165. Return of examination of four brass Whitworth 12-pr. guns after firing 200 rounds at Shorncliffe; *Best* 2891; *App.* 165. Return of Armstrong guns issued up to 1st August 1863, showing the number of rounds fired, the station to which they were issued, with cost of alteration or repair as far as is known at Woolwich; *App.* 167-200. Returns of examination of competitive 12-pr. Armstrong and Whitworth guns; *App.* 202, 231-235. Return of examination of experimental fuzes, lubricators, 70-pr. shells, &c., travelled for 20 days in a Flanders waggon; *App.* 243, 244.

## RICHARDS, WESTLEY. See BREECH-LOADERS.

RICE, EDWARD CAPTAIN, R.N. (*Analysis of evidence.*)

Commanded H.M.S. "Algiers," had on board one 110-pr. and two 40-prs. Armstrong guns; fired 32 rounds from them, the practice was very good; 1904. No accidents occurred; 1905. The men preferred muzzle-loaders from the feeling of a sense of insecurity about breech-loaders, and the latter are slower at loading; 1909. Less danger in loading breech-loaders, but in firing them they are more liable to accidents than muzzle-loaders; 1915. Observed no injury to, or inconvenience with the Armstrong projectiles; 1916. Weight of vent-piece in 110-pr. a cause of slowness in loading; 1919. Found the fuzes all right; 1924. Would prefer a muzzle-loader; 1927. No inconvenience from the recoil of an Armstrong gun; 1931. Liked the 40-prs. very much, preferred them to the 32-prs. of 45 cwt.; 1935. Believes the element of accuracy not so important at sea as on land; for naval purposes a heavy blow at short distances the main object; 1940. Would prefer the 68-pr. to the 110-pr. Armstrong, as a broadside gun; but the 110-pr. as a pivot gun.

## RIFLED GUNS:

Evidence states that where the same weight of projectiles and charges are used, that the effect of the rifled gun is greater against iron plates than the smooth-bore; *Armstrong* 164. A very trifling difference in rapidity of fire between a muzzle-loading and breech-loading rifle gun; *Cox*, S. 291. Witness considers that the rifled gun is one which has given the greatest range when compared with the smooth-bore; its accuracy meets every requirement; *Milman* 725. 764. Evidence states that whichever of the rifled guns has the most enduring power, and carries the heaviest charge, thus giving the greatest velocity, is the gun that will effect greatest injury on iron armour plates; and witness prefers the rifled gun for the broadside; *Hay* 1832-1840. Witness would prefer the Whitworth as a rifled pivot gun, and prefers the smooth-bore to the rifled gun for the broadside, and mentions the bursting of two rifled cast-iron guns on board the "Lynx" at Kinburn; *Seymour* 2028. 2031. 2033. Evidence would not propose to arm ships entirely with rifled guns, and would only have a proportion for special purposes; *Hewlett* 2149-2151. Witness mentions an instance

where in firing and manœuvring rapidly with a 9-pr. gun and 24-pr. howitzer against an Armstrong gun, that the effect of the smooth-bore was rather better than the rifled gun, the men and officers being hurried in both cases; but in a question of range the rifled gun is unquestionably superior; *Gardner* 2701. Statement that a shot has more chance of sticking in the bore of a rifled gun than in a smooth-bore; *ib.* 2687. Evidence is in favour of rifled guns, for certain circumstances, and alludes to the impression, both in America and Prussia, that a certain proportion of smooth-bores would be useful, and is inclined to have smooth-bore and rifled guns in separate batteries, half of each, the feeling in Prussia and elsewhere was that about one-third rifled guns was the best proportion; *ib.* 2729, 2730. Witness mentions the rifled gun as best for breeching batteries at long ranges, and gives instance of the importance of the rifle gun for siege operations; *ib.* 2745-2749.

#### RIFLING :

Evidence of the pitch of rifling for the Whitworth guns; *Whitworth* 39-44. 3982; *App.* 161. Witness describes the object of the shunt rifling, and gives twist for 300-pr. and field guns; *Armstrong* 147. 168. 190. 191. Witnesses mention the injury to the rifling of a brass 12-pr. Whitworth gun at Shoeburyness; *Cow*, S. 303; *Alderson* 619; *Taylor* 1498. The bursting of shells in Armstrong guns does no serious injury to the rifling; *Alderson* 618. 701. 702; *Liddell* 1128; *Milward* 1387; *Taylor* 1504; *Hewlett* 2049. Opinion that the bursting of a shell in a Whitworth gun would not seriously injure the rifling; *Bower* 1694. The projectiles from heavy guns sometimes strip, and do not take the rifling if the guns are not properly run up; *Alderson* 652. Opinion that the rifling of the Whitworth gun would not cause any great strain from the rapidity of the twist; *Bower* 1657, 1658. 1689. Witness mentions the experiments at Woolwich trying the effect of torsion on various systems of rifling; and states that whatever kind of rifling is adopted that the projectile should always have a soft coating to preserve the gun; *Hay* 1836. Witness mentions deposit from fouling in the angles of the Whitworth gun; *Hewlett* 2099. 2105. Evidences have no confidence in the severe rifling twist in the Whitworth gun; *Cow*, S. 300; *Hewlett* 2190. Evidence gives the amount of torsional resistance of the Lancaster, Armstrong, Scott, and Whitworth's systems of rifling, and mentions that there is very little tendency to burst in the 10-grooved Armstrong shunt gun; *Anderson* 2480-2483. Witness does not consider there is any danger from the rapidity of twist in the Whitworth gun; *ib.* 2485. Evidence is strongly against the shunt mode of rifling; it is difficult to manufacture, and considers it is not simple enough, and is of opinion that any incline will cause the projectile to twist to a centre; *ib.* 2584-2596. Statements of the wearing of the rifling of certain brass 12-prs. after practice; *Isacke* 2836; *Best* 2891; *App.* 165. The witness of opinion that with the hexagonal rifling of Mr. Whitworth, if the bore should happen to be made of wrought iron, it would be much injured if a shell burst in it; *Anderson* 3016. If the projectile leave the bore a steady fit, and is long enough to take its direction from the bore, and has whirl enough to keep it up, it will be accurate in whichever way these conditions are accomplished; *ib.* 3171-3176. If it were a question between the shunt rifling and the Whitworth, the witness would prefer the Whitworth. The Armstrong multi-grooved gun is the easiest of all other to rifle; *ib.* 3179-3183. 3203-3207. Witness states that the cost of any kind of rifling is trifling compared to that of the gun; *Noble* 3606-3608. Rule stated for the grooves in the rifling of the 150-pr. 300-pr. and 600-pr. Armstrong shunt guns, to be 6, 8, and 10 each respectively; *ib.* 3663. For the pitch of rifling for the Armstrong and Whitworth guns, see tabular statement; *App.* 159-161. Witness maintains there is no system of rifling as cheap as the polygonal system; *Whitworth* 4094.

#### ROTARY MOTION :

Statement that by diminishing the charge a very long shell may be fired from the Whitworth gun by giving plenty of rotary motion; and the Whitworth guns have double the rotary motion of other guns; *Whitworth* 35-37. 3969-3974. As long as the requisite rotation is given, it does not appear to make any

difference whether you give it by grooving or polygonal sides. Certain projectiles require a particular rotation, and it is a matter of indifference how it is given; *Armstrong* 164; *Anderson* 3171-3176. The velocity of rotation is very different in the Armstrong and Whitworth guns; *Milman* 749; *Bower* 1606.

ROUGH USAGE. See ENDURANCE.

#### S.

#### SAFETY :

- 1st. Of the Armstrong gun.
- 2nd. Of the Whitworth gun.

##### 1st. Armstrong gun.

Witness states that a properly manufactured Armstrong gun would be found impossible to burst, no matter what is done to it; *Armstrong* 136. Evidence is of opinion that if the vent-piece was made indestructible, that the Armstrong gun might be regarded as perfectly safe; *Cow*, S. 401; *Liddell* 1121; *Hewlett* 2158. Opinion of the feeling of safety from bursting, of the Armstrong gun; *Cow*, J. 415. Evidence that the coil system of manufacture gives very great confidence and security; *Alderson* 721; *Liddell* 1148; *Taylor* 1524. 1531; *Hewlett* 2157; *Anderson* 2377. 2412; *Gardner* 2718, 2719. Mention of the safety of the Armstrong gun and the contrary of the Whitworth; *Noble* 3463-3471.

##### 2nd. The Whitworth Gun.

Evidence of the safety of the Whitworth gun from the strength of its construction, and statement that the steel hoop is twice or three times as strong as the wrought-iron hoop; *Whitworth* 3830-3836. Evidence of the confidence felt in the 9-inch, and that a Whitworth gun of any size may be made of good material; *ib.* 3960-3968.

#### SEVENTY-POUNDERS. ARMSTRONG AND WHITWORTH GUNS.

Witness mentions the first 70-pr. Armstrong made had the movement of the wedge breech-closing arrangement from the side, from which an escape of gas took place, but afterwards it was entirely obviated by improvements made; *Armstrong* 126. Description of the shell for the 70-pr. Armstrong shunt gun; *ib.* 180. Evidence mentions the difficulty of loading the 70-pr. Whitworth gun, and states that the 70-pr. Armstrong is better than the Whitworth, but the range of the latter was somewhat the longest. Gives opinion favourable to the 70-pr. Armstrong side-loading gun, and, as an instance of the rapidity of fire attainable with it, 50 rounds were fired in 32 minutes and 32 seconds. Has also seen good practice with the Armstrong 70-pr. shunt gun; *Cow*, J. 495-503. 539-543. 568-573. Witness thinks that the side-loading arrangement of the 70-pr. is good; *Alderson* 597. Evidences contrasts the initial velocities and charges of the 70-pr. Whitworth and Armstrong guns; *Milman* 745-748. Evidence of the performance of the 70-pr. Whitworth gun against iron plates at Shoeburyness; *Harrison*, A. 1410. Statement of a 70-pr. Whitworth gun that was used against iron plates at Shoeburyness having been made on the coil principle; *Taylor* 1528. Witness states that 100 70-prs. were being constructed at Elswick; and mentions the giving way of the side-loading arrangement of a 70-pr. Armstrong gun; *Gordon* 1763. 1772. Evidence favourable to the 70-pr. Armstrong wedge gun, and considers it safer than the vent-piece principle, and well adapted for ships; *Hewlett* 2077, 2078. Statement that steel barrels were first introduced for 70-pr. Armstrong guns towards the end of 1862; *Noble* 3277. The steel from the Bessemer process might be adopted for guns of sizes up to the 70-pr.; *ib.* 3290. Preference for the 70-pr. with steel tube over the 70-pr. with coiled tube; *ib.* 3315-3318. Peculiar construction of the breech screw plug, and superimposed coils; *ib.* 3574-3580. Cost of the finished barrel of 70-pr., 210*l.*; *ib.* 3594. The breech-loading 70-pr. Armstrong gun was made 15 cwt. lighter than the muzzle-loading 70-pr., as the former was intended for a shell gun; *ib.* 3614-3621. Witness states that the 70-pr. Whitworth at Shoeburyness with 10 lbs. of powder attained a range nearly equal to that when a charge of 12 lbs. was used; *Whitworth* 3838. The competitive 70-pr. has the hoop next over the barrel in three layers, put on as one hoop, at the same time the succeeding hoop also in three, the trunnions

screwed on and an extra hoop, in consequence of the vent being from above; *ib.* 3911-3921.

SEYMOUR, FREDERICK BEAUCHAMP, C.B., CAPTAIN R.N. (*Analysis of evidence.*)

Commanded naval brigade in New Zealand, the practice not satisfactory from the 12-pr. Armstrong guns; do not think it was more accurate than the firing from the 9-pr. brass guns; observed some shot strip very much; 1993. An accident occurred in the "Harriers" boat by the vent-piece coming out, and injured eight men; 1995. Tried, but could not hit a sap roller at 750 yards with either a 12-pr. Armstrong or an 8-inch gun; 1996. The great objection to the Armstrong gun is the quantity of gear and screws about it. Could not land it uninjured on a beach in a heavy surf; 2000. Coehorn mortars more effective than 12-pr. Armstrong in turning the enemy out of the rifle pits; 2,008. Thinks that confidence has not been gained in the Armstrong gun from the experience in New Zealand; 2014. Would prefer a muzzle-loader to a breech-loader; 2015. Thinks that the smoke which comes from the breech when the vent-piece is taken out a great objection between decks; 2016. Do not think the 12-pr. Armstrong a good boat gun; 2018. If allowed the choice in fitting out a ship, would not have an Armstrong gun on board; 2027. Would prefer the Whitworth gun for a pivot, but not as a broadside gun; 2028. For the broadside prefers the smooth bores, from the great rapidity in the loading; 2031. The advantage of the smooth-bore howitzer is the possibility of firing grape and case with it, and for this purpose is superior to a fire with segment shell; 2044.

SHELL GUN. *See* HOWITZER.

SHOT, SHELL, AND SHRAPNEL. *See* PROJECTILES.

SHRINKING. *See* COIL AND STRENGTH.

SHUNT GUN. *See* MUZZLE-LOADERS.

SIGHTS:

Statement that if the sights of the Armstrong gun were shot away, that as good practice would be made as with the 12-pr. smooth-bore, and there would still be the ratchet sights to fall back upon; *Cox, S.* 289, 290. Witnesses state that in sending the Armstrong guns away in boats, the sights would be taken out until mounted in the boat; *Liddell* 1038-1040; *Becher-vaize* 1247-1265. Evidence mentions that if the side sight of an Armstrong gun be shot away, that there is still the middle line of sight to fall back upon; *Milneard* 1493. Witness of opinion that although the Armstrong sights are admirably adapted for certain special purposes, yet they are not simple enough for ordinary service; *Gardner* 2656. Letter relative to the adjustment of the sights of the competitive Armstrong and Whitworth guns; *App.* 209.

SIX-FOUNDER ARMSTRONG AND WHITWORTH GUNS.

Evidence proposes the 6-pr. Whitworth gun, and mentions certain particulars regarding it; *Whitworth* 1. 10-14. 23. 25. 45. 62, 63; *App.* 161. Statement of the dimensions and weight of an Armstrong 6-pr.; *App.* 159, 160. Average per-centage of failures in the manufacture of the 6-pr. Armstrong; *Anderson* 2967.

SIX HUNDRED-FOUNDER ARMSTRONG GUN:

Witness is of opinion that it will require a large gun, such as the 300 or 600-pr. to do any damage to iron-plated ships; *Alderson* 662. Evidence mentions that the tempering of such a large mass of metal as the shot for a 600-pr. would cause it to become brittle and "fly;" *Noble* 3398. Mention of the number of grooves in the 600-pr. Armstrong to be 10; *ib.* 3663. The value of the steel barrel for the 600-pr. is 600*l.* before anything is done to it; *ib.* 3708. Dimensions, weight, and other particulars of the Armstrong 23-ton or 600-pr. gun; *App.* 159.

SIXTY-EIGHT-FOUNDER SMOOTH-BORE GUN:

Evidence states that it is easier to work the 68-pr. than the 110-pr. Armstrong; *Cox, S.* 383; *Alderson* 648; *Milman* 804; *Rice* 1911. 1919. The penetration of the 68-pr. and the Armstrong 110-pr. against the cupola shield were nearly alike; *Liddell* 977. Witness states that it is not usual to carry guns so heavy as the 68-pr. on the broadside of a ship, but is of opinion that it will be necessary to have them to contend against iron-plated ships; *Hay* 1841. The evidence prefers the 68-pr. to the 110-pr. Armstrong for

a broadside gun; *Rice* 1942. Witness states the 68-pr. was the best gun on board the "Miranda," and considers that nature of gun to be preferable to any other; *Seymour* 2022-2027. Evidence would prefer the 68-pr. for contending against iron-plated ships at short ranges; *Gardner* 2704.

SMOKE:

Evidence complains of the amount of smoke which escapes from the Armstrong gun when the vent piece is taken out, and considers it an objection on board ship; *Seymour* 2016. Witness has not found the slightest bad results from the smoke from the Armstrong guns in the "Excellent," and considers it to amount to no more than with a smooth-bore; *Hewlett* 2210, 2211. Evidence felt no inconvenience from the smoke from Armstrong guns on board the "Defence;" *Powell* 2237.

SMOOTH-BORE GUNS:

Witness claims his rifle gun to be a smooth bore; *Whitworth* 92. Preference expressed for the smooth-bore instead of the rifle gun for the broadside, from the greater rapidity of loading possible with it; *Seymour* 2031-2032. Evidence prefers the smooth bore for the broadside; would recommend a proportion of rifled guns for special purposes, but the majority should still be smooth bores; *Hewlett* 2151. Witness would take for the armament of a ship the majority of smooth bores and muzzle-loaders, and the minority of Armstrong breech-loaders; *Powell* 2282. Evidence would be inclined to recommend the armament of field artillery to consist of half smooth bores, half rifled guns, to be kept in distinct batteries; *Gardner* 2730.

SOFT METAL. *See* FRICTION.

SOLID FORGINGS. *See* FORGINGS.

SPONGES:

Witness mentions that, in order to test the Whitworth gun, he fired without sponging; recommends that the sponge head for a rifle gun should turn on a pin; *Bower* 1652-1654. 1736. Evidence states that there is a difficulty in getting the sponge into the angles of the rifling of the Whitworth gun; and having seen the sponges with revolving heads used in the "Excellent" is of opinion they do not answer; *Hewlett* 2061. 2101-2103.

STEEL AND HOMOGENEOUS METAL:

Statement that homogeneous metal is only another name for steel having very much less carbon in it than ordinary steel; and description of its manufacture at Messrs. Firths' works; *Anderson* 3092-3096. Evidence of the first Armstrong gun being constructed with a steel barrel, which method is still preferred if steel of good quality could be procured, and the manufacture of the inner tubes of wrought iron has been caused by the difficulty of providing steel of a reliable, and even strength; mention of the improvement in the quality of steel and the advantage of using it for the barrels of Armstrong guns; *Armstrong* 123-125; *Anderson* 2408, 2409. 2418-2428. 3088; *Noble* 3271-3277. 3323. Witness has great confidence in the strength of the Whitworth guns made of homogeneous metal; *Hewlett* 2190. Evidence that the Armstrong firm pay no patent right for using steel barrels for their guns, and denial by the steel makers that they pay Mr. Whitworth any royalty on the use of steel for the barrels of guns; *Noble* 3228. 3247-3249. The steel ingots for the barrels of Armstrong guns are supplied by the makers solid; great care is taken in testing the quality of the steel, and a large per-centage are rejected from the flaws and cracks to which this metal are subject. The testing takes place before the barrels are bored, but even after boring barrels are sometimes rejected for flaws; *ib.* 3228-3238. 3252-3256. The defects in steel increase very much in large masses; in consequence of which the rejections of the barrels the 150 and 300-prs. is very much greater than the 12-prs.; *ib.* 3241-3246. Witness expresses doubts that the uncertainty in the manufacture of steel will ever be removed, and states that the mildest description he has seen has not been capable of resisting percussive action equal to wrought iron, and therefore is of opinion it will never equal that metal for the exterior of guns, but considers that the improvement in steel will permit of its being safely used for barrels; *ib.* 3327-3337. 3510-3513. All experience goes against the belief of witness that

steel should be better than wrought iron for the exterior of guns, mention of the failure of Whitworth guns supplied to Egyptian and Danish governments; *ib.* 3466-3471; *Anderson* 2425. 2426. The use of steel in the solid form is being given up by all governments for guns, and mention of the failure of the Krupp gun made with a large barrel and superimposed steel coils; *Anderson* 2412-2415; *Noble* 3515-3518. The tempering of steel in oil increases its hardness and toughness; its effect upon vent pieces has been greatly to add to their strength and safety, rendering them able to bear heavy blows without breaking. The working of the process is determined by the practical knowledge of the men employed; the evils of tempering in large masses are greater than the advantages to be gained; when barrels get crooked in tempering it denotes a want of homogeneity in the metal. If a 600-pr. shot were tempered and fired against iron plates it would be sure to "fly" from the tension existing in the mass; *Anderson* 3018-3034; *Noble* 3374-3401. Witness states that Messrs. Firth, steel makers, agreed to pay them a royalty on the steel barrels made by them of 2 per cent.; *Whitworth* 3733-3747. The steel barrels for the Whitworth gun are sometimes cast hollow and sometimes solid, and when received are subjected to a hardening and tempering process; *ib.* 3760-3772. The proportion of steel ingots rejected for the Whitworth guns is small; *ib.* 3788. The strength of the steel material of the Whitworth gun is two or three times as strong as wrought iron, and witness considers that if guns are required to stand large charges wrought iron would not stand as well as steel; *ib.* 3833-3836. 3942. Statement that there was no failure of the guns supplied to the Egyptian Government, and that the Danish gun made by Mr. Whitworth burst from too much air space behind the projectile; *ib.* 3876-3889. Opinion of evidence that the manufacture of steel has arrived at such perfection that there is no limit to the size of Whitworth gun that may not be made, and considers a gun with three feet bore may be constructed; *ib.* 3960-3966. Evidence of the success of projectiles made of homogeneous metal, when fired against iron plates; *Harrison, A.* 1410-1412; *Whitworth* 4008-4016. Opinion that percussive action is not injurious to steel in a gun if it is properly tempered; *Whitworth* 4105-4107.

#### STICKING OF SHOT IN THE BORE:

Witness allows that the shot were liable to stick in the bores of the first guns made by him; *Whitworth* 84. Evidence of an instance of a shot sticking in the bore of a Whitworth 12-pr. brass gun; *Cox, S.* 301-306; *Cox, J.* 506; *Alderson* 619; *Taylor* 1498-1500. Witness in practising with Whitworth guns has never seen shot stick in the bore; *Boxer* 1646. Statement of the difficulty of getting the shot home in a Whitworth gun, and mention that the jolly boat's mast with ropes attached were used with a number of men to bump it home; *Hewlett* 2072.

STORK, H.M.S. *See* ACCIDENTS.

#### STOWAGE:

Evidence of the stowage required for the Armstrong gun on board ship for the ammunition, and opinion given that if the 40-pr. Armstrong and 32-pr. smooth bore be compared, that the rifle gun will not require more stowage for its ammunition than the other; *Liddell* 1187-1191; *Bechervaise* 1281. The Armstrong projectiles require greater care in stowage than the round shot, but not than the grape and case; *Bechervaise* 1284.

STRAIN. *See* STRENGTH.

#### STRENGTH OF, AND STRAIN ON GUNS:

Evidence states there may be some particular Armstrong guns defective, but as a general rule there is an abundance of strength in them; *Armstrong* 135. Witness gives his opinion that although the rapidity of twist in the Whitworth gun may wear the bore, yet the gun will stand an immense number of rounds; it may give increased strain, but that does not matter when the gun is of wrought iron, steel, or brass; *Power* 1658. 1688. Evidence alludes to the strains which various systems of rifling have been found capable of sustaining by experiment; *Hay* 1836; *Anderson* 2480. Witness gives the circumferential strength of the wrought iron coils of the Armstrong gun as 25 tons per square inch, and longitudinally it varies from 10 to 14. The solid forged

wrought iron tube has a strength of about 22 tons in both directions; *Anderson* 2350-2363. Evidence that if careful measurement be maintained that there is no doubt about the amount of strain put upon the coils of the Armstrong gun; *ib.* 3077-3081; *Noble* 3547. Statement of abundance of strength in the Armstrong gun to withstand a very good "pinch"; *ib.* 3168. Opinion that Mr. Whitworth ventures a great deal in giving his guns such a rapid twist, but thinks them strong enough to bear it; *ib.* 3181-3183. Witness mentions that for strength in the Armstrong gun the chief dependence is placed on the coils outside; *Noble* 3300. The strain to which the coils are subjected, in the Armstrong gun, is a tensile strain percussively applied; it is well known to persons acquainted with iron that tensile strength is no test for fitness to withstand percussive strain; *ib.* 3484-3498. Mentions Mallet's investigations, would consider wrought iron better than cast, from the "constant" so to speak being high. Therefore wrought-iron guns may be expected to last longer than cast, and steel better than iron, yet they both have the same defects from flaws, and the outer layers add little to the strength of the gun; *ib.* 3528-3530. Witness mentions that the process of hardening and tempering the barrels for the Whitworth guns adds 50 per cent. to the strength of the metal; *Whitworth* 3801. The strength of the steel for the Whitworth gun is two or three times as strong as any wrought-iron hoop, and witness contends that a gun made of wrought iron will be unable to stand the strain of heavy charges, and that steel must be used for guns requiring great strength; *ib.* 3833-3836. 3941, 3942. 4063-4065. Opinion that percussive action is not injurious to steel or homogeneous metal, if it is properly tempered; *ib.* 4105-4107.

TAYLOR, ARTHUR J., COLONEL R.A. (*Analysis of evidence.*)

Has carried on no experiments with the Whitworth gun except against iron plates, and a trial of the rapidity of fire between them and the Armstrong; 1480. The trial was in favour of the Armstrong gun, that of the Whitworth being unsatisfactory in consequence of delay; 1481. Mr. Whitworth has now remedied these defects; 1482. Believes the fire of Mr. Whitworth's brass muzzle-loader to be slightly more rapid than the Armstrong breech-loader; 1485. Considers breech-loading guns best adapted for the field. If the vent-piece can be guaranteed, would not ask for more. Considers neglect has been the cause of the majority of accidents with vent-pieces; 1487. The caution of the man in loading only required with the breech-loader, and no liability of accident from neglect of the man who sponges; 1488. thinks it would take less time to clean an Armstrong gun ready for action than a muzzle-loader, if they had both been upset into mud; 1491. The contingency of the lever being shot away the only serious objection to the Armstrong gun; 1493. Prefers the rifling of the Armstrong to the Whitworth gun, as should a shell burst in the latter it would prevent further loading; 1498. Bursting a shell in the Armstrong gun does not disable it; 1504. The greatest penetration of iron plates has been attained by the Whitworth muzzle-loading gun; 1508. These guns have been fired with very heavy charges and projectiles of totally different material from the Armstrong; 1511. The proportion of charge for the Whitworth gun is too great for the Armstrong, from the relative weight of the guns; 1512. Considers it an unfair test of a gun to fire it with a larger charge than that for which it was constructed; 1522. Has not seen a Whitworth gun injured except that mentioned; 1525. Mr. Whitworth's two guns used against iron plates were on the coil principle; 1528. Not having seen a Whitworth gun fail, as to the matter of its construction, has no fault to find with it. Thinks the mode of the construction used for Armstrong guns sound, reasonable, and calculated to give confidence; 1531. Believes the Whitworth gun perfectly safe; 1534.

As a solid shot does not object to the Whitworth projectile, but as a shell, it is not to be compared to the Armstrong in its present state; 1537. There would be an economical advantage in using the common fuze with the Whitworth shell, but they would not be less liable to deteriorate; 1539. Gives instances of rapid firing from different guns. The only instance seen of difficulty in loading with lead-coated projectiles was at Portsmouth, when six out of 123 would not go into the gun; but it did not take more than a minute with a hammer to make the projectiles all right; 1542. Has found the old pattern Armstrong time fuze deteriorate considerably; 1545. In firing rifle shot against masonry and earth-works, they turn continuously to the right after striking; 1547. Gives instances of penetration of masonry; 1549. Refers Committee to tabular forms contained in the "Report on Ordnance," 25th July 1862, pp. 155 to 177 and 267, for ranges and initial velocities of the guns under consideration; 1551. We have instances of Armstrong guns which have been in constant work, and fired considerably over 3,000 rounds, and are still quite serviceable; 1552. Has had no accidents with these guns except the breaking of vent-pieces, and the bursting of the 150-pr. smooth-bore gun: attributes that to having tried it beyond its strength with increasing charges; 1555. In the manufacture of this gun an error was made in the position of a safety-valve, intended to relieve it of some pressure from the gas. More strain was consequent than was intended; 1557. The effect of the molten iron shell from the Armstrong gun not very great, no difficulty with the lead from melting; 1563. The new pattern Armstrong projectiles do not strip. Believes that the effects of this stripping in the old shot was exaggerated. Could never trace the flight of a piece of lead beyond 100 yards; 1566. The fragments were very small; 1568.

#### TEMPERING

Witness states that the new method of toughening the vent-pieces in oil has been highly successful, and that the difference between the raw steel vent-piece and that subjected to the tempering process is enormous, as tested by blows; *Armstrong* 207. By the method of tempering steel in oil the tenacity is increased 20 per cent., and still more its power of resisting compression, and you nearly double the tenacity, at the same time there is much to learn in the practice of it, from the heat of the oil being required to be a particular temperature; *Anderson* 3018. Not necessary to temper the steel barrels after the form is given to them, as they can be turned afterwards, and pressed home by 2,000 tons pressure. The process of tempering is a very simple matter and long used; witness does not think there is anything in the oil by itself, but in the crystallization which is due to the rate of cooling, and fully describes the manner pursued in tempering in oil; *ib.* 3018-3043. The tempering of steel in oil adds much to its hardness and toughness. The working of the process is left to the practical knowledge of the men employed; the evils of tempering in large masses are greater than the advantages to be gained. Sometimes barrels get crooked in tempering, thereby denoting want of homogeneity in the metal. So large a mass of steel as a 600-pr. shot would, if tempered, be liable to "fly" when fired against armour plates; *Noble* 3374-3401. The steel supplied for the manufacture of the Whitworth guns is subjected to a hardening and tempering process by being heated to a certain temperature and immersed in oil, the proper heat for each piece of steel being found by experiment; and the witness feels perfect confidence in this temper being properly applied to a large mass of this metal as easily as to a small one; *Whitworth* 3731. 3766-3773. 4101-4104. The Whitworth barrels are first turned and bored before tempering; *ib.* 3736. The temper given to the steel projectiles is different to that of the gun barrel; they are made harder and the metal of which they are composed contains a little more carbon; *ib.* 4098-4100. Percussive action is not more injurious to steel or homogeneous metal than to wrought iron, if it is properly tempered, the whole value of steel depending upon the treatment of it; *ib.* 4105-4108.

#### THREE-HUNDRED-POUNDER ARMSTRONG GUN:

Witness submits to the Committee the 300-pr., weighing 12 tons, rifled on the shunt principle, and proposes to provide it with projectiles for use against

ordinary objects, and also special projectiles of steel available for use against armour plates; gives the calibre as 10½ inches, and the twist of rifling one turn in 65 calibres. The steel shell to be about two calibres in length, containing a bursting charge of 12 to 14 lbs. of powder; *Armstrong* 164-168. Witness considers that no gun under 300-pr. or 600-pr. can do any real harm to armour-plated ships; *Alderson* 662. Statement that prior to the introduction of Mr. Whitworth's special projectile the "Warrior" target had only been penetrated by a shot from the 300-pr. smooth-bore gun; *Harrison, A.* 1414. Witness mentions that the 150-pr. which burst at Shoeburyness was of the same size and calibre as the gun known as the 300-pr. rifle gun, the former being employed as a smooth-bore; *Taylor* 1561. Evidence states that in the larger Armstrong guns, 300-prs. and so on, have all shown a weakness from a particular cause, and mentions his objection to the method of plugging up the end of the inner tube, and recommends instead a solid inner tube supported from behind by a large screw; *Anderson* 2488. For dimensions, weight, &c. of 12 ton gun or 300-pr., see Letter, tabular return; *App.* 156. 159. The difficulty of obtaining the steel barrels for 300-pr. free from flaws; *Noble* 3241. 3246. Witness mentions the number of grooves in the 300-pr. shunt to be eight; *ib.* 3663. Statement of the cost of ingot of steel for the barrel of 300-pr. to amount to 300*l.*; *ib.* 3626.

#### THREE-POUNDER WHITWORTH:

Witness proposes the Whitworth 3-pr., and mentions its range at Southport, and other points connected with it; *Whitworth* 1. 8. 20. 25. For dimensions, weight, cost, &c. of Whitworth 3-pr. gun; *App.* 161.

#### TIME FUZE. See FUZE.

#### TIN PROCESS. See COATING PROJECTILES.

#### TOUGHENING IN OIL. See TEMPERING.

#### TRAINING:

Witness states that he was not satisfied with the facility for training the 110-pr. Armstrong gun on board ship, from the shortness of the carriage owing to the nature of the gun; *Powell* 2228.

#### TRAJECTORY:

Witness mentions the importance of the low trajectory of the 1-pr. Whitworth gun; *Whitworth* 4. Evidence cannot conceive anything more to be desired in the Armstrong gun as far as range is concerned, except lowering the trajectory a little; *Liddell* 945. 946. Opinion that lower trajectories will be obtained by using gun cotton than with gunpowder; *Whitworth* 3942-3947.

#### TRAVERSING:

Witness has applied the traversing bar to his guns, but not to those made lately, having learned that military men prefer the simple movement of the trail; *Whitworth* 56. Evidence mentions the decided advantage of the traversing arrangement with Armstrong guns; *Milman* 821, 822. Witness considers that the traversing screw would not be of any use on board ship from the sheering about, and other causes; *Liddell* 952. Witness mentions the importance of the traversing arrangement to the Armstrong guns, as it permitted him to lay his guns without shifting the carriage when acting in very soft ground in China; *Milward* 1358.

#### TRIALS. See EXPERIMENT.

#### TWELVE-POUNDER ARMSTRONG AND WHITWORTH GUNS:

##### 12-pr. Armstrong gun.

The 12-pr. Armstrong proposed to the Committee as a field gun; *Armstrong* 119. Witness mentions the severe proof some 12-prs. have stood, gives the number of fragments into which the 12-pr. shell breaks up into, and the prices at which the shell are manufactured; *ib.* 136. 152-155; *Noble* 3670-3675. Evidence favourable to the 12-pr. Armstrong gun; *Cow, S.* 285. 286. 294. 352; *Cow, J.* 415. 419; *Alderson* 580; *Liddell* 954, 955; *Milward* 1327; *Taylor* 1486, 1487; *Hewlett* 2110, 2111. Opinions that the 12-pr. Armstrong gun was useless for boat service; *Glyn* 1947. The practice of Armstrong 12-pr. in New Zealand was unsatisfactory; *Seymour* 1993. 1996. 2018. Opinion

that the 12-pr. Armstrong was unfitted to stand the rough usage of the service; *Glyn* 1947; *Seymour* 2000; *Gardener* 2609. 2645. 2672. 2685. Evidence mentions the difficulties he has found in working with the 12-pr. Armstrong; *Bower* 1623-1639. Witness states the details connected with the manufacture of the 12-pr. Armstrong gun at the Royal Gun Factories; *Anderson* 2351. 2359. 2364-2371. 2374. 2389-2393. 2397-2405. 2459. 2967. The competitive 12-prs. supplied to the Committee are alike in construction; *Noble* 3225. There is little difficulty in obtaining the steel barrels for the 12-prs. in good order and free from defects; *ib.* 3238. The cost of the steel barrels for the 12-prs. are proportionately much less than for the larger natures of Armstrong gun, in consequence of the ease in obtaining the steel ingots of that size free from flaws; *ib.* 3303-3305. Statement that all the 12-pr. steel barrels are tempered in oil; *ib.* 3375. Dimensions, weight, calibre, and cost of 12-pr. Armstrong gun and projectiles, &c.; *App.* 159, 160.

#### 12-pr. Whitworth gun.

Witness mentions the length of range attained by 12-pr. Whitworth, and gives other particulars connected with it; *Whitworth* 6. 7. 9. 13. 17. 39. 62. 3724-3727. Evidence of the extreme accuracy of the 12-pr. Whitworth gun; *Alderson* 623; *Milman* 736-747; *Bower* 1621; *Gardner* 2731. Witness states that the 12-pr. Whitworth equalled the 12-pr. Armstrong in facility of working; *Alderson* 624. Statement that the 12-pr. Whitworth guns at Hythe were worked very easily; *Isacke* 2804. Witness considers that of the two guns the 12-pr. Whitworth is easier worked than the 12-pr. Armstrong; *Best* 2949. Evidence of a 12-pr. brass Whitworth having become damaged in the bore, and would not permit of loading in consequence; *Cox*, S. 301. 306; *Cox*, J. 506; *Alderson* 619; *Taylor* 1498-1500. Evidence of the experiment carried out at Shoeburyness between 12-pr. breech-loading Armstrong and Whitworth guns for rapidity of fire; *Taylor* 1481-1485. Statement that there is no difference in the construction of the 12-pr. competitive guns from the others which have been hitherto made; *Whitworth* 3722-3724. The cost for the steel for the 12-pr. Whitworth is 60l. per ton, and the manufacture of the gun increases the price up to 120l.; *ib.* 3782. 3804. Dimensions, weight, calibre, cost, &c. of 12-pr. Whitworth gun, with projectiles; *see App.* 161.

#### TWENTY-POUNDER ARMSTRONG GUN:

Evidence proposes a short 20-pr. of 13 cwt. for field service as a howitzer or shell gun; *Armstrong* 194. Witness recommends two short 20-pr. Armstrongs for each field battery, and considers them very good shot guns up to 3,000 yards range; *Alderson* 605-609. Recommendation of the introduction of the short 20-pr. as a shell gun for field artillery; *Milman* 842, 843; *Milward* 1325-1327; *Desborough* 1466; *Hewlett* 2121. Witness mentions his approval of the projectiles for the 20-pr. Armstrong gun; *Milman* 855. 857. Statement that the accuracy of the 20-pr. Armstrong is not equal to the other natures of Armstrong guns; *Bechervaise* 1202. Witness mentions that the 20-pr. had been reduced in weight to adapt it to boats; its recoil is violent, but still prefers it to the 24-pr. smooth-bore howitzer; *Hewlett* 2116, 2117. Evidence of the details of manufacture, and the number of 20-prs. manufactured and proved; *Anderson* 2394, 2395. 2531. 2967; *App.* 164, 165. Dimensions, weight, cost, &c. of 20-pr. Armstrong gun, with detail of stores accompanying it; *App.* 159, 160. 162. 164.

#### U.

UNDERCUTTING. *See COATING PROJECTILES.*

#### V.

#### VELOCITY:

Witness states that in consequence of the larger bore of the Armstrong guns, comparatively to the Whitworth system, that the former can start the projectile at a higher initial velocity, although, from atmospheric resistance, it is not retained so long; *Armstrong* 168-173. Evidence mentions the initial velocity of the 12-pr. Armstrong gun at 1,242 feet per second; the 70-pr. Whitworth, with shell, 1,184, and 1,062 with shot. The velocity of rotation is very

different between the Armstrong and Whitworth projectiles; *Milman* 745. 749. 754. Statement that the gun which can stand the greatest charge, and thus give high velocity, will be the best for the penetration of iron plates, when the material of the projectile is best adapted for the work to be done; *Harrison*, A. 1424. Witness states that the initial velocities of the various guns under consideration will be found in the Report on Ordnance, of 25th July 1862, page 267; *Taylor* 1551. Opinion that the rifle gun which can stand the heaviest charge, and thus give the highest initial velocity, will effect the greatest injury to the iron plates; *Hay* 1832. Evidence of the increase of velocity and range gained by shortening the shot of the 110-pr. Armstrong to the weight of 68 lbs.; *ib.* 1840. Witness mentions that in the Lancaster guns used in the Crimea the muzzles had all the work to do when the shot was going out with enormous velocity; *Anderson* 2480. Tables of mean observed velocity, and the comparative gain or loss of velocity of the 12-pr. Armstrong and Whitworth guns; *App.* 368-371.

#### VENTS:

Evidence prefers the vents for the Whitworth guns being placed in the continuation of the axis of the gun, as interfering least with the strength of the piece, and when it is placed in the ordinary manner on the top thinks it necessary to have an extra hoop on the Whitworth guns; *Whitworth* 3750-3753. 3935-3937.

#### VENT-PIECES:

Evidence on the plan of construction for Armstrong guns, and mention of the vent-piece being tightened up by breech-screw; *Armstrong* 123. Opinion that for large guns the wedge principle was best, as avoiding the necessity of lifting the vent-piece; *ib.* 126. The vent-pieces made at the early stages of manufacture of the Armstrong gun were made of steel, and subject to variation in quality; they have since been made of Swedish iron, which has been successful; but a perfect vent-piece should be made of mild steel, tempered in oil; *ib.* 217. Evidence that the vent-pieces of the Armstrong guns are liable to be blown out or injured on firing when made without the projecting strengthened back; *Armstrong* 211; *Cox*, S. 251. 255. 385; *Cox*, J. 436. 450. 464-466; *Alderson* 592; *Liddell* 986-996; *Bechervaise* 1224; *Milward* 1359-1361; *Taylor* 1555; *Seymour* 1995; *Hewlett* 2134-2136; *Powell* 2228. 2233-2239; *Anderson* 2514; *Gardner* 2640. 2645. 2662. Statements that the new pattern vent-pieces for Armstrong guns with projecting backs are not liable to be blown out, or injured from firing; *Armstrong* 159. 214; *Cox*, S. 247. 248. 252. 253; *Cox*, J. 436; *Alderson* 593; *Milman* 901; *Liddell* 995-1000; *Taylor* 1487; *Hewlett* 2138-2144. Witness states, in opposition to the above, that the projection at the back of the Armstrong vent-piece is not a security against their being blown out; *Gardner* 2646, 2647. 2659-2661. Evidence of the difficulties experienced in the working of the vent-pieces of the 110-pr. Armstrong, from their jamming, owing to the tin cups used to stop the escape of gas; *Cox*, S. 368; *Alderson* 656; *Milman* 828. 901-909; *Liddell* 1008, 1009. 1035; *Bechervaise* 1210-1212; *Powell* 2294, 2295. 2305; *Gardner* 2638, 2639. Statements that the vent-piece of the Armstrong gun is the weak point in the system; *Cox*, S. 399-401; *Alderson* 587; *Milman* 912, 913; *Bechervaise* 1274; *Harrison*, A. 1424; *Taylor* 1487. Evidence of the heating of vent-pieces in Armstrong guns from continued and rapid firing; *Cox*, S. 335-337; *Cox*, J. 454-457; *Gardner* 2645. Statement that since the addition of handles to the vent-pieces, that there has been no difficulty in removing them when hot; *Cox*, J. 458; *Liddell* 1175. Witness mentions that rapid firing in some cases causes the loosening of the copper ring on vent-piece, which is generally the forerunner of the breaking of the vent-piece; *Cox*, S. 338-342; *Liddell* 1173. Evidence of difficulty found in lifting the vent-pieces of the heavy Armstrong guns; *Cox*, S. 367; *Milman* 790-793; *Anderson* 3000. Opinions that there is no difficulty in lifting the vent-piece of the 110-pr. Armstrong gun; *Liddell* 1051-1054; *Rice* 1919; *Hewlett* 2082. Statement of witness that the proof of vent-pieces is expensive, and has caused the destruction of a large number of guns. That the different changes of pattern in vent-pieces has occasioned difficulty in supplying ships of war on distant stations, unless an accurate description of the gun, and the number of the vent-piece injured be given; *Gordon* 1775-1779. 1805-1809. Witness gives

opinion that the weight of the vent-piece in the 12-pr. Armstrong is objectionable, and if it is not weighty it will break, and if the breech-screw is not home a blow on the vent-piece is more liable to injure it than when it is screwed home; *Anderson* 2514, 2529. The material for the manufacture of vent-pieces is now had from Sheffield, also a particular brand of Swedish iron used in their construction, called "C and half moon." The vent-pieces tempered in oil have sustained a severe trial by firing, and it is found that they will not break when tested under the steam hammer; *Anderson* 2526-2528, 2534-2536, 3024.

### W.

#### WADS:

Witness states opinion that if the Whitworth gun were adopted it would be necessary to use a wad to keep the shot home; *Hewlett* 2061. Witness recommends the use of a stiff oakum wad with the Whitworth gun to prevent the rush of gas through the windage; *Whitworth* 4073.

#### WASHING:

Evidence of 100 rounds being fired from Whitworth guns without requiring washing out although no lubricating wad had been used; *Whitworth* 82.

#### WEAR AND TEAR:

Witness contends that the wear of the Whitworth gun in the bore is not caused by the friction of the projectile but is more due to the action of the gas, the powder chamber being the part of the bore that wears most; *Whitworth* 103-106, 4073. Evidence is of opinion that the rapidity of twist in the bore of the Whitworth gun has a tendency to wear it out; *Coar*, S. 300. Statement that although the Whitworth gun may wear the bore from the rapidity with which the projectile is turned round, yet it will stand an immense number of rounds. The wearing in a brass Whitworth will cause increased windage and not affect the accuracy to any considerable extent; *Boxer* 1658-1660. Opinion that the projectiles coated with soft metal possess advantages over the Whitworth projectiles, as the latter with hard metal surfaces are more liable to wear the bore of gun from friction; *Hay* 1836. Evidence mentions the wearing of certain brass Whitworth guns which had been under experiment at Shorncliffe; *Isacke* 2835-2837; *Best* 2891; *App.* 165.

#### WEDGE GUN. See BREECH-LOADERS.

#### WEIGHT:

Evidences give opinions as to the limit of weight which they think correct for broadside guns; *Hay* 1840, 1841; *Hewlett* 2083; *Powell* 2266. Weights of Armstrong and Whitworth guns; *App.* 159-161.

#### WELDED METAL. See FORGING.

#### WHITWORTH JOSEPH, ESQ. (Analysis of evidence.)

The Manchester Ordnance and Rifle Company are making 1, 3, 6, and 12-pr. field guns; would recommend a 9-pr. to be used as a field gun instead of a 12-pr. Mentions the performance of the 1-pr. as superior in range to the 12-pr. of the service, and contrasts their relative mobility; 1. Reckons the calibre by the diameter of the circle circumscribing the bore; considers that wherever the 1-pr. can be substituted for the small arm rifle it would be an immense advantage; 4. Have not yet made a 9-pr.; 11. The guns mentioned are muzzle-loaders, but has some 12 and 6-pr. breech-loaders; 13. The charge is one-sixth the weight of a shot of three diameters in length; shells are sometimes made four or more diameters long; 16. Considers a brass 12-pr. may be made of 10 cwt., but would not recommend it lighter; 17. Having stated to the Committee the guns made, leaves it to them to select; 21. Recommends the use of a separate gun for shell firing; 26. Has not got the plan for shell gun settled yet, but contemplates increasing the calibre without adding to the length of the projectile; 30. Claims to fire longer projectiles from his guns than were thought of before; has fired some 10 calibres long without difficulty by diminishing the charge, and giving plenty of rotary motion; 34. Would permit of a shell and shot being fired from the same gun. But would have a larger one for shrapnel; 46. The fuzes in the Whitworth projectiles are ignited by the flame of the charge passing over the shell; 50. Recommends muzzle-loading for field guns; 52. Con-

siders that the danger owing to refuse flannel being left behind in the bores of guns would be obviated by the use of solidified powder; 54. The shell takes the ordinary fuzes of the service; 75. The windage of the gun is given on the going in side, leaving the coming out side perfect; the metals have their full bearing throughout. The bore is peculiar, it has 24 surfaces; 78. Any amount of windage required can be given; 82. Would recommend the use of a lubricating wad; 83. Have had no cases of the shot sticking in the bores since the first guns made, which had not enough windage; 84. Considers that the possibility of jamming the projectiles in the bore to be no more than with any smooth-bore gun; 92. Thinks that the action of the gas will wear the bore of the gun more than the friction of the projectile; 103. The powder chamber the part of the bore that wears; 104. The details of the shrapnel shell has been left with Colonel Boxer; 115.

#### Further examination.

Relative to the expense of the Whitworth guns, witness is prepared to answer any questions; it is difficult to pronounce on the cost of a thing; 3721. There is no difference in the construction of the guns furnished for experiments of the Committee, and those previously made; 3722, 3723. The 12-pr. is made of homogeneous metal tempered, and is a solid gun, 3724-3726. The materials for the construction of this gun is supplied partly by Krupp and partly by Firth; each piece is tested and subject to the hardening and tempering process; 3728-3731. Messrs. Firth agreed to pay a royalty of 2 per cent. for all gun material which they supply to others, for using our patent right, with the exception of the supply sent to the American States. It was not considered a royalty, but was agreed to in consequence of the assistance rendered to them; 3732-3747. The different apparent construction of the gun furnished for the experiments from those previously manufactured has been caused by placing the vent in a position not originally intended for it; 3748-3753. The trunnion-piece is put on cold by the screw. The ring on the breech-piece is put on by hydraulic pressure, and not by heat; 3754-3758. The barrels are sometimes cast hollow, and sometimes solid, they are hammered at the steel factory and afterwards tempered in oil, hardened and tested in the Whitworth works; 3760-3777. The price of the metal is from 60l. to 90l. per ton, according to size; the comparative value of the metal when worked up depends on the size of the gun. Before tempering, the barrel is first turned and rough-bored, and a piece taken off from the end to test the metal; 3779-3787. The proportion of ingots rejected is small; the makers would take them back, the loss of the workmanship being paid by the Whitworth firm. After the tempering process the barrel is again turned on the outside, and then gets the finish boring and the rifling; great exactness in tempering is required for the sake of the cutting tools, 3718-3798. The additional value to be placed upon the material after the tempering process varies with the size of the gun, that for the 12-pr. costing 60l. per ton, and as the gun weighs half a ton, and is sold for 120l., it would give the producing cost as four times the original value of material, which includes profit. It is difficult to state the cost of each process in the manufacture of the Whitworth gun; 3799-3809. The cost of the projectiles is of more importance than that of the gun, from the lasting nature of the latter, while the projectiles are continually being used. The present cost of 60l. per ton for gun material is no criterion of what it will come to, and it is probable it can be had for 30l. The Bessemer steel has in some instances been found very good by the Whitworth firm, and costs from 30l. to 40l. per ton. It is now being extensively used on railways; 3810-3819. Having found Messrs. Firth's metal exhibited much inequality, the Whitworth firm erected a steel works and now produce steel with more certainty. The Bessemer material for guns is preferable to iron, but it is not equal to the material melted in the crucible in the ordinary way. Only one Whitworth gun has been made of the Bessemer metal. Is prepared to give the Committee the results of the proof of the gun material for strength, and to show everything in confidence to the president and another member of the Committee. When the gun material shows no flaws, has perfect confidence in it; any defect in the ingot would be made known during the

process of manufacture; 3820-3832. The strength of the Whitworth gun material is two or three times as strong as wrought iron. The cost of its manufacture will always be more than wrought iron, but it is much cheaper, as if guns are to be made sufficiently strong, wrought iron would be unable to stand firing large charges of powder and long projectiles. Would not have anything to do with guns firing small charges. The best weight for a 7-inch gun would be 7 tons. With the slow burning powder used at Shoeburyness a charge of 10 lbs. with the 70-pr. Whitworth only gave 100 yards less range than before obtained by 12 lbs. of a quicker powder. The range at Southport with 12 lbs. of powder was 10,300 yards, firing on level ground; 3833-3852. Considers that if the charge of the Whitworth gun is 10 lbs. that the charge for the shunt gun should be 15 lbs. from the area of the bore being half as much again. The trunnions of the Whitworth gun are turned out of a solid block, and has the screw put upon it, the metal being the same as the other part of the gun. They have sometimes been made of wrought iron; 3853-3862. The Armstrong gun manufacture having been established some time, it has become as good as they are likely to get it. This is not the case with the Whitworth factory, as they look forward to a great diminution in price of the material. On comparing steel and iron rails, it has been found that the steel will last ten times as long, and their first cost is only 50 per cent. over the iron. A Danish gun supplied by the Whitworth Company burst. There has not been any account of other guns having failed, the success of those supplied to the Confederates has been heard of. There has been no failures with the guns supplied to the Egyptian Government. The bursting of the Danish gun was caused by too much air-space between the charge and the projectile; it burst into several pieces. At the time it was made there was no exact way of testing the metal; 3865-3892. In all cases of manufacture of 7-inch guns the bore is not completed until the hoops are put on, by hydraulic pressure, on a tapering portion of the gun, the relative proportion of the guns ruling the amount of taper given; for instance, with a taper of one inch in a hundred, the tube is forced up about  $\frac{1}{100}$ ths of an inch beyond the fit; by this means a more certain knowledge of the strain put on the material is known than by shrinking on by heat. Whatever the size of the gun the hoops are of the same metal; 3893-3904. The force exerted by the hydraulic pressure has been found sufficient to force on the hoops and prevent the barrel turning in the hoops. In the 70-pr. Whitworth the hoops placed over the barrel have been made in three layers, connected by a screw and pushed on at the same time. The experience gained by experiments still causes a preference for the position of the vent being in the axis of the piece; by so doing there is no inequality caused in the strength of the breech. But for the ignition of the cartridge it is better to fire it in the centre than at the end; 3907-3922. In the guns sent to foreign countries the breech piece has been screwed in the same way as the 70-pr. delivered to the Committee. No complaints have been received of the screw shifting; in some experiments at Shoeburyness it has done so, but that was considered satisfactory, as showing the ease with which it could be removed if necessary; it could easily have been prevented by the insertion of a key. The guns supplied to foreign governments have had the vent on the top, but the vent at the end of the breech is preferable, 3927-3937. The steel for the outer rings is proved in the same manner as that for the barrel. A gun manufactured with steel barrel, and having wrought-iron hoops superimposed is not so expensive as a gun made like the Whitworth gun, but for the sake of the future, with reference to the ammunition likely to be used, it has become desirable to have the strongest gun possible. The results of experiment with gun cotton are remarkable, with regard to recoil and the lowness of the trajectory. For its use a gun of the strongest material would be required, while the weight may be diminished; 3938-3951. The method adopted by Krupp of making guns of steel solid is objectionable, as being likely to cause unsoundness. It would be desirable to make the barrels for large guns hollow, such as 15-inch or 10-inch. The manipulation of steel has arrived at so much certainty as to permit us to feel every confidence in the 9-inch Whitworth of 16 tons. On the built up principle, the soundness of the steel ingot would allow of a gun being made with a

3-feet bore. The weight of solid shot for 9-inch is 320 lbs.; 3952-3964. There is no limit to the size of gun that may be made, but considers the gun of the smallest bore capable of doing the work would be the best, and recommends the use of shells of five diameters in length to be used against ships. The pitch in the rifling of the 9-inch is in the same proportion as the smaller guns; 3965-3982. The cost of the Armstrong and Whitworth guns cannot be contrasted by the price of the material, as the metal for each is received in different stages of manufacture. The turning of steel is slower than wrought iron, requiring more to be spent in wages; as steel becomes more perfect the hoops can be made to require less turning. There would not be a very great difference in the expense of shrinking on coils and putting them on by hydraulic pressure; 3983-3992. The cost of the projectiles supplied to the Committee cannot be taken as a fair criterion of their future cost, and considers that the fairest method of contrasting them with the Armstrong is to take into consideration the time taken up in the manufacture; 3993-4007. Steel projectiles were used for the Whitworth small arm rifle in 1857, and with large projectiles against the "Alfred" in 1858. wrought iron for projectiles is practically useless for penetration; 4008-4013. The witness was informed that at Woolwich arsenal the projectiles for the shunt and Whitworth guns have been made; 4019, 4020. Recommends that the Whitworth projectiles should be tooled after casting, although they can be fired without; the tooling costs 5*l.* per dozen for 12-pr. shot. The iron used is common cast iron. The manner in which shells break up seems to be in relative proportion to the length of the shell; 4021-4038. Recommends the use of stronger powder to get greater penetration and range, and mentions the good results obtained from gun cotton and compressed powder together; 4039-4066. Has known no instance of the barrels turning round, and thus spiking the gun by moving the place of the vent. It was stated that the Whitworth gun would wear in its bore from the friction of the hard metal, and that the shot would jam; such, however, is not the case. Recommends the use of a stiff oakum wad, to prevent the rush of gas getting past the shot and wearing the gun. No lubrication would be required. Found the wear of the 70-pr.  $\frac{1}{100}$  of an inch, after firing 1,000 rounds. There is no means of determining how many rounds the guns will stand; 4067-4090. Considers it would be beneficial if experiments were made with one gun, to watch effect of continual firing with it, taking measurements every 500 rounds. One system of rifling is as good as another if properly made. It is a question of economy; there is no system as cheap as the polygonal system taken in connexion with the projectile; 4091-4097. The steel of the projectiles contains more carbon than that in the guns; they are made harder. The whole value of the steel in the guns depends upon the skill of the treatment it receives in the tempering process. The method of melting steel has an element of certainty, superior to the puddling of wrought iron. Has suggested that the naval establishments might be made available for the manufacture of guns. The ores used for making the steel are foreign, made with charcoal principally from Sweden and Russia; 4098-4114. The steel hitherto supplied by the Whitworth firm in guns and projectiles has not been made by themselves. The price for which there is a large contract for 70-pr. Whitworth is 500*l.*; 4119-4132.

#### WHITWORTH GUNS:

Evidence considers the Armstrong gun of iron more durable than the Whitworth of brass, and mentions the difficulty in loading the Whitworth gun; *Cox*, S. 299-302. Witness thinks the 70-pr. Armstrong better than 70-pr. Whitworth, but the range of the latter was a little over. Mentions the sticking of shot in the bore of the Whitworth at Shoeburyness. Considers the Whitworth gun best for penetration; does not consider the Whitworth shell good; *Cox*, J. 498-500. 506-513. 529-533. 558-563. Statement of a Whitworth gun being disabled by a shot injuring the bore. It was equal to the Armstrong in accuracy and range. The Whitworth has beaten the Armstrong in penetration. A shell bursting in the bore of a Whitworth gun would be liable to injure it. The range of the Whitworth is comparatively greater than the Armstrong, as it has a larger charge; *Alderson* 619-624. 663-666. 693. 706. Evidence states the ranges of the Whitworth brass field guns were greater

than the Armstrong, and that their accuracy was very great. There is not the same capacity for shell-firing in the Whitworth as in the Armstrong; *Milman* 734-742. 849-851. Mention of the achievement of the Whitworth guns in the penetration of iron plates; *Harrison, A.* 1404-1423. 1436. 1440-1444; *Whitworth* 4008-4016. Witness mentions the experiments between Armstrong and Whitworth 12-prs. to test rapidity of fire. Gives reason for preferring the Armstrong mode of rifling, and considers that a shell bursting in the bore of a Whitworth gun would prevent further loading with it. There is no doubt that the greatest penetration of iron plates has been attained by the Whitworth gun. Has no fault to find with the construction of the Whitworth gun. Objects to the form of the Whitworth projectile from the difference of length in the shot and shell, and considers the Whitworth shell arrangement not to be compared with the Armstrong. In the use of the fuzes there is an advantage in point of economy in the Whitworth gun; *Taylor* 1480-1485. 1498-1502. 1507-1509. 1531-1539. Evidence mentions his experiments made to determine the best form for the Whitworth shrapnel shell carried on with a brass 12-pr. Whitworth. The form of the shell was found satisfactory. The ordinary service time fuze was used, and no lubricators were required, which is a defect in any system to require a large amount of. If sufficient windage be given, it is not likely that shot will jam in the bore of the Whitworth gun. Considers that a gun rifled on the Whitworth system has as much chance of endurance as an Armstrong gun. The cost of the Whitworth projectiles is less than the Armstrong, the same metal being used in the construction. The cost of Whitworth 40-pr. is 3s. 4d., the solid shot about 2s. 2d. Some shells burst in the bore of the Whitworth gun and did no injury, but the bursting charge was small; a common shell with large bursting charge might injure the bore. It would not be safe to fire the ordinary case from a Whitworth gun; *Bower*, 1570-1582. 1644-1650. 1657-1660. 1666-1670. 1694-1697. 1732. Evidence mentions his opinion that the hard metal surface of the Whitworth projectiles will injure the bore of the gun. States that the accuracy of fit now given to Whitworth projectiles and the addition of the sabot has done away with the difficulties in loading. The principal merit for penetration of iron plates is due to Mr. Whitworth, although his shell did not convey through the iron of the target sufficient bursting charge to render it formidable; *Hay* 1836. 1841. 1849. 1850. 1856. Evidence states a preference for the Whitworth gun as a pivot, and mentions that the Americans approve of it; *Seymour* 2028, 2029. Witness states that he was directed five or six years ago to report on the Whitworth gun, and that he considered its accuracy and range very great, but doubted its safety. Since that time several of the guns burst. Objects to the hard metal surfaces working together in gun and projectile. Found difficulty in loading from the fouling deposit in the angles of the rifling, and hardening there; at first the shot went in easily, but in running out the gun found the shot started from its seat, necessitating the use of a wad. Mentions the splitting of the 80-pr. Whitworth gun of homogeneous metal. The penetration through water with flat-headed projectiles from a Whitworth brass howitzer was very good. The Whitworth gun has been more successful in the penetration of iron plates than any other gun; *Hewlett* 2051-2073. 2168-2170. 2188. Evidence considers that the hard metal surfaces of gun and projectile in Whitworth system, and the rapidity of twist, will not cause undue wearing away of the gun from friction; the comparative amount of torsion required to burst the Whitworth gun is placed by experiment

a 28 tons. The Whitworth method of breech-loading for guns is not likely to give satisfaction. The bursting of a shell in a Whitworth gun would injure the bore, if made of wrought iron, but if made of a steel harder than Krupp's it would not be so much damaged. By the method of putting on the hoops of the Whitworth gun on a conical surface by hydraulic pressure the full strength of the metal can be developed, if sufficient pressure is applied; *Anderson* 2475-2480. 2485. 3001. 3016. 3017. 3090, 3091. Witness considers the Whitworth gun wonderfully accurate, and to prevent shot sticking in the bore would recommend the shot to be cleaned before placing them in the bore; *Gardner* 2731, 2732. Evidence of the results of practice with 12-pr. brass Whitworth guns, which was considered good, although no accurate ideas of the practice could be formed, the targets being moored at sea. One of the guns fired 20 rounds in 13 minutes and 40 seconds. In firing the shrapnel shell prepared by Colonel Boxer, did not think that the practice obtained was as good as that with the Armstrong gun. There was no difficulty in loading the Whitworth gun. The guns were of two different weights, 11½ cwt., and the other 14½ cwt. After the firing the grooves of the Whitworth guns appeared to have worn a little. The accuracy of these guns was very good. The Whitworth gun is easier worked than the Armstrong; *Isacke* 2801-2803. 2806-2808. 2818-2821. 2825, 2826. 2835-2837. 2849-2851. 2854. 2859. Witness gives evidence relative to experiments with brass 12-pr. Whitworth guns. States that the shot before the Committee having a coating of brass upon it was fired from a Whitworth gun. Noticed wearing in the bore of the Whitworth after firing. Considers the practice from the Whitworth guns was much worse than that obtained from the Armstrong gun. Found no difficulty in loading the Whitworths. After dismantling the experimental guns, the light Whitworth of 11 cwt. was first into action, and although dirt had entered the muzzle, there was no difficulty in loading. The Whitworth gun is better than the Armstrong for ease of working, although not so good for practice; *Best* 2873-2881. 2891. 2899-2903. 2931-2939. 2949-2951. Statement of the Whitworth guns offered for competition, with general detailed description of them; *Whitworth* 1-115. 3720-4132. Cost of the guns manufactured on the Whitworth system, together with the methods pursued in their construction, and description of the material used, and the method of treating it; *ib.* 3720-4132. (See Analysis of evidence.) Tabular statement of dimensions, weights, rifling, and other particulars of the Whitworth guns offered for competition; *App.* 161. Examination return of four 12-pr. brass Whitworth guns after firing 200 rounds; *App.* 165.

#### WINDAGE:

Witness states that in the Whitworth gun the windage is left on the going-in side of the projectile. As much windage can be given as is considered requisite; if much is given the powder is wasted, but the shooting is not injured. In the early Whitworth guns there was not enough windage allowed. It is entirely a matter for experiment; it was found at the experiment at Shorncliffe that there was abundant windage; *Whitworth* 77. 82. 84. 91. Too little windage in the experimental Whitworth gun at Shoeburyness a cause of difficulty; *Taylor* 1481. Witness considers that the rush of gas through the windage of the Whitworth guns tends to wear the bore; *Whitworth* 4073.
